I did read it

And I reread it, to make sure of the terminology of what I was talking about.

Go back to the books, Prozac. Your still making a fool of yourself.

And learn elementary electronics before you try to become a technician.

Lou Franklin's books don't teach everything, but you would never guess by
your posts!

Well, in my experience, the faster you turn those alternators, the higher the current goes. I run a stock chevy pulley on the crank, but the pulley on my alternator(s) is only about an inch and a half in diameter. Makes that shaft rotate like mad.

This is the same alternator that rates 202A at 18+ volts.

>
> I want this as my daily driver. No shoot outs in the UK.

We can change that, you know?

Think UK customs would let me bring my suburban in if I was to go to work for Conoco in Aberdeen? (Scottish customs... Sorry)

>
> Is this what you do to guarantee max torque from the engine to turn
> those 8 alternators with minimum drag or do you match max alternator
> output to max engine RPM? Am I missing something?

We usually take the alternators and mount them.

There. Spin them as fast as you can.

Peak output.

If that isn't fast enough, build a nitrous motor.

Or, take the route that one of the big AC boys does... His brother is a pro drag racer, and he gets the engines for next to nothing (comparitively).

This makes for a nice engine, built for high RPM revs, as well as lots-o-torque for spinning the Electrodynes!

> >
> >
> >> Spinning them faster 'should' only generate more heat, not amps:-)!
> >
> >Not necessarily true.
> OK, I'll accept this, even though I don't fully understand how.

Well, I have to take part of that back... Spinning the alternator doesn't produce more current, per se, but it will allow you to run higher voltages at a given current level.

With that said, you can get 18 volts constant out of the alternator (designed for 14.4) at 165 amps, same as the other guy, with a slower shaft rotational speed, with lower volts.

Make sense in this regard?

> >People are running 3CX3K amps on a single alternator, using a 14 inch or
> >bigger mainshaft pulley, and getting full power out of them because the

> >stator.
> God, a 14" pulley on the crank. That's a monster pulley!

Yes. Sludgehammer has a monster on his crank on his old Suburban.   I have yet to see his new ride.

One of the DaveMade AC vehicles in Memphis last year also had a 14 or 15 inch Billet crank on his.

I will try to get some pics this year.

> = Class-C amp maybe 8-9KW of RF, yes/no? or maybe more using your
> experience.

Probably more, full field.

I see lots-more current out of an alternator when run full field, rather than running it regulated.

I don't think that a regulator can produce the voltage necessary to get the field fully energized. I am thinking of trying a 24 volt field system (running a small alternator to power the field system, then using that to run the bigger alternators) as a test. This would also allow more current out of the big alternators, as they would not have to put the field current up themselves (which can run over 7A DC)

>
> That'll do nicely, make that with heavy on the onions and fries.

I am on a diet. But no tomatoes and heavy catsup!

>
> <snip>
>
> From their standard range the C712 is rated 12V @ 400A. The output curve
> shows a peak of 425A at 8000 RPM but IMO is still rising. This is where

> approximately 385A.

Loss of 15 amps? Not bad at all.

Leece Nevilles go from 200+ amps to 165 amps when going from rated to operating temp!

>
> I'm sure most people know that alternators do not like excessive heat
> but I think they do not realise just 'how' important it is to keep
> things as cool as possible.

That is starting to happen, what with people running external rectifiers.

What some of the people running the external rectification systems don't realize is that they can see even more current if they use EXTREMELY fast diodes in their bridges.

I found another 20 or so amps that way once! The diodes where not fully rectifying the AC component because they where designed for sub 150 CPS.

You can do the math... When a stator has a field energized by a rotor spinning 10K or more RPM, what do you think the output frequency is!?

>

> They mention that their alternator design is as much as 25% more

> Do Leece or Electrodyne use claw-pole rotors?

Not sure about Electrodyne, but I do believe the Leece is the Claw-Pole
design (brushed).

Agreed, but does the supply have an internal resistor to supply this
needed?? load?

I have a few radios for sale, an HR2510, RCI2950, CHEROKEE CM-5, and a
Washington base station. I also have a Silver Eagle slightly used, also
a Phantom 10 tube that does over 1K depending on what you drive it
with. 1 Dosy test center and PDC 700 if interested E-mail me and leave
your number. If you need power supplies I have trip lite pr50 and 60's
thank you. I will respond to all inquiries.

Wait, after rereading this....

> OK GUYS
> GOT TO GOOD THE MAN IS CLOSE!!!!!!!!!GOT TO SELL MY STUFF
> BUILT BY A HAM OP

Who gives a shit? Does that attest to the quality?

> HOMEBREW AMP
>
> RUNS .... 10 YES 10 3-500ZG EIMAC TUBES

Should run Amperex. Better tubes, higher gain, and they make a better graphite tube!

> 4500 VOLTS AT 10 AMPS

You have a 45Kw power supply?

Transformer will have to be lifted with a crane! I have a 6500 volt 5 amp power transformer and I can't lift it. Needed an engine hoist to get it out of the suburban!

POWER SUPPLY WITH 100 AMP
> POWERSTAT

You mean variac, right?

.. 220 VOLT 50 AMP BREAKER NEEDED TO RUN

So let's see.

You need 10Kw of input to get 15Kw of output! And that is with a 45Kw power supply!

Pretty good, I must say!

> THIS THING   ..VAC CAPS ... OIL CAP...VAC RELAYS...
> ROLLER INDUCTOR TUNE...

Must be a HUGE roller inductor, considering what the plate currents are going to be.

The roller inductor in most all of the antenna tuners (3K rated) won't handle a single 3CX1500A7 when used in a pi network. The Q is too high because of the transformation ratio needed.

This inductor must be half the size of the RF deck, and ribbon wound at that!

Besides, with those tubes, current ratings and such, you will almost be able to hook the plate cap up directly to the antenna!

TUNED INPUT..

Well, how the hell else are you going to drive all those cathodes?

BIG WINDOW TO SEE

I have a Cobra 25 LTD Classic. It  come with echo/reverb, 5 tone roger
beep, and "Good, Bad, and Ugly" noise toy. Internal speaker has been
removed to make room for the toys. I will also include a Valor external
speaker that has talkback.

$20.00 + $8.00 shipping

I was referring to the way that you like to ride Mad Dog's leg...

Seems to me that if I wanted to get a remark, comment or answer to you as
quick as possible, the best way was to address it to Mad Dog.... Seeing as
how you two seem to hold hands so well!

Really?

Page 59, ARRL Solid State Design for the Radio Amateur

(see figure on Page 60, Fig. 27)

A protective measure for unballasted transistors is seen in fig 27. A Zener diode is connected as a peak voltage clamp from collector to ground. Assuming the Max collector voltage will be twice the supply amount (comes out to 24 volts), ZD1 is not part of the circuit. However, should a load mismatch occur, or the stage break into self oscillation, the collector RF voltage will soar to high values. At that point, ZD1 will conduct at 36V and clamp the voltage above that value, thereby protecting the transistor. Furthermore, should voltage spikes occur on the supply line, the zener will clamp at 36 volts or higher, thereby again protecting the transistor. If protection from positive and negative swings is desired, two zeners can be bridged from collector to ground, back-to-back fashion. ARRL lab tests indicate that no degradation in amplifier performance results from use of Zener diodes at hf and mf, provided the diode conduction point is well above the normal RF voltage peak value. No evidence has been found that ZD1 enhances harmonic energy output."

Banded end of the Zener to collector, unbanded straight to ground.

I was wrong in the value. Been a while. Should be 36 volts (or anything above around 30). Late nights are catching up with me.

I, too, am impressed.

Best bang for the buck, in a small SSB rig.

If you want AM only, the Pro510XL is another screamer. Put a D-104 Minteman behind either one, and you have a talker.

Did the dumb thing of hooking up my Diawa PS-50TM to a 7.8volt battery to
charge in and now the thing puts out 26 volts instead of 9-12.  I hate to
have to throw this thing away so does anyone know how to repair it and what
to check for?  Should I change the variable resistor that changes the
voltage?  I have checked that with a a multitester and it looks bad.  Any
other ideas???? Thanks!!!

When you raise the voltage on your dc amp you will increase the current draw
as well, call Dave and ask him, then maybe you will believe someone.

Toll old 747,KY should be there again this year, with a new line section
3-1/8" bolted directly to back of the box compared to the bird 43 1- 5/8"
he blew off of it last year. It will be interesting to see how he fairs this
year if he doesnt break, 3 alternators on 2-3000's in sky is kinda rough
He is going up against guys with quite a bit more oooomphh in the alt and
tube dept. perhaps he can sneak one of em... get some good pixs like last
year.. we love em...

I have already read a lot of the books, but most of what I know and believe
in is derived from my own personal experiments, which I do on a daily basis,
I tried the one with the zener diode, and I do not see any problem with it.
Not so far.

Change out the pass transistor(s).

Most likely they are bad, and are now not regulating.

On an extreme case, their is a regulator (usually an IC on the bigger
supplies) that can also be bad, not regulating to the pass transistors, but
I would check the big transistors mounted to the heat sink first.

And you have put the proof in this comment, man we have been here a while, we are used to it, For someone who claims to know so little, your sure do know a lot, This argument going old has happened before, I can tell you for a fact that when you test with a current meter on an amplifier using 2SC2879's you will see the current go up when increase the voltage to the amp, there is a lot of phenomenon's involving dc amps that might not make since, but will show the same in every test you make, For instance if you take an 8 pill box and key it at 3400 bird and talk it down to 1800 bird what do you think the current meter would show? I can tell you this at 1800 watts the 8 pill will draw around 200 amps, but it will draw more on key and swing down on the current meter.

Of course we will.

Shadow is working with Calvin this year... Last year, we did it alone.

If we can get something going with Calvin, we should be able to get a lot more pics.

And your right... If he wouldn't have blown the line it would have been
somewhat more interesting!

sir, as the well known and respected protector of english grammar on this ng and supported by my dozens of fans out there, I protest your abusive misuse of the written text. Please check your spelling. I realize that we are all not perfect , but obvious error is not necessary, unless you know not what you do, which is indicative of a lack of good schooling. This new age and its learning methods , so prevalent in today's screwals, of which you probably, cough, cough, 'graduated', is a most disturbing part of today's society. If you do not know that you are making a lot of grammatical errors, then I for one, want my damn money back, for paying through the nose to make you functional in this world, and I think the damn school districts of this country should be entirely ashamed at what kind of product they produce.
Thank you , thank you very much, ...icm out..............

******

This is great and all, but wouldn't it be easier to just use a 14' length piece of some quality RG-X foam (at cb frequencies) coaxial cable and simply tune the antennas?

I use this method on a daily basis and it seems to work very well....actually, depending on the type of vehicle, I have had good results with various lengths between 13' - 18' feet! I do realize though that the mounting location and surrounding body metal, (or lack thereof) plays heavily into the overall results!

To account for the above I am looking at another method. With the mobile antenna in it's final location, (mounted) first tuning the antenna by conventional means (your method also sounds interesting) using various lengths in the above mentioned range and then using a noise bridge to be able to measure things such as radiation resistance or impedance as well as values of inductive and capacitive reactances........Tell me what you think!

Jack

You wrote:

Size does matter......how to trim your coax for best performance.

Guess what? Mobile antennas are not 50 Ohms! Honest injun. Because of this, coaxial cable acts as an impedance transformer. So if it is anything other than an electric half wave (or even multiple thereof) the reading you take with your 50 Ohm VSWR meter at the radio end will be erroneous. This is not conjecture and I will not answer anyone challenging this premise.

There is an article in the latest MRT magazine that talks about the easiest way I know of trimming your coax for best performance with a mobile antenna - specifically quarter wave antennas. I'll translate how to do it for CB radio. You'll need a radio, a VSWR meter, 50 Ohm dummy load & a PL259 "T" connector. Attach the radio to the input of the meter - no magic here. Attach the "T" to the output of the meter. Put the 50 Ohm dummy load on one output of the T. Attach a PL259 connector to your coax and screw this into the other output of the T. The coax should be unterminated, that is, NOTHING attached to the end. Key up the radio, set your forward calibration, flick to reflected. Prune the coax until the reflected power drops to nothing. I suggest trimming off about 1/4" at a time. At every electrical half wave length of coax the VSWR will drop to 1:1. (This could be handy if you need more than say a 12ft run.) Take the cable off of the T, strip it back and solder, or screw on, to your mount. When your antenna is perfectly tuned it will measure an SWR of about 1.3:1 - this is totally normal, and totally acceptable.

That's it!

With the mobile antenna in it's
final location, (mounted) first tuning the antenna
by conventional means (your method also sounds
interesting) using various lengths in the above
mentioned range and then using a noise bridge to be
able to measure things such as radiation resistance
or impedance as well as values of inductive and
capacitive reactances....

That is how I do it, and when it is found that the impedance is not a true 50 ohms, I design a small L network at the base of the antenna to compensate.

Most mobile antennas are usually somewhere in the area of 36 ohms. The fact of the matter is, the extra 4 feet in an 18 foot piece of RG-8/X foam will "add" the other 14 ohms, so to speak. For the most part, (with some exception) 18 feet of good grade 8M or 8X coaxial usually works very well!

Yes I have heard of meteor skip!  The meteors positively charge the
atmosphere at the point of entry.
Temporarily creating skip conditions.

Cool aaaa!

I didn't see anything that said the relay was sticking. And #12 is correct as long as you put the tape between the coil core and the contactor arm. It keeps the contactor arm from touching the core and remaining stuck there due to the magnetization of the core over time.

I have an Icom IC-728 all band, all mode compact hf transceiver for sale. Rig is in like new condition with no scratches, scuffs or blemishes of any kind. Never been mobile. Rig has optional AM/FM board installed. Comes with power cord, HM-12 up/down hand mic, SM-6 desk mic, full manual and all original boxes and packing. This is GREAT buy. I'm only selling to pay off New Knwd TS-570 SG I just purchased. If serious about buying, email me for photos of the rig. Buyer pays shipping. Will sell only in Cont. US. You can check out my ebay feedback as user ID rpemers@aol.com.

Thanks,

Ron

Hey Toll, Did you notice that he ripped off my swing kit (from www.pantherco.com) and added it to his sight under Galaxy. I made that kit years ago after experimenting with Silicon switching diodes. He even has a little diagram of the back of the board. He changed the resistor value so it would be a little different. He would be better off with my value..

```

Toll is exactly right.
Prozac, you say that as voltage goes up current goes down. That's based on
P=E x I
(power=voltage times current).
And assumes a constant power/wattage.

However, power is not a constant in the amp situation. As voltage goes up,
so does power.

Why does this happen?
(take notes here)

Focus on the following:

E=I x R
(voltage equals current times resistance)

R is the load resistance, which is the resistance on the C-E junction of the
power transistor. For a given input, this resistance is constant.
So with a constant R in E=I x R, E and I are directly proportional (see
definition or proportional at the end of this post).

So, if we want to solve for power, substitute E (in the power equation) for I x
R:
P=(I x R) x I
P=I^2 X R
(Power equals current squared, times the resistance)
So, increasing voltage proportionally increases the current.
Increasing current geometrically increases the power.

NOT just my .02. Do some experiments and see it yourself.
Thanks,
Josh

SWRs have nothing to do with mode,so if they are good when operating AM
on the CB band they will be the same when operating SSB.

I heard that it wouldn't be too bad 40 ch up or down from CB
> but that the SWR's would hit the roof when I go 80 ch up or down form

> Channel 28

You will have to check the bandwidth but the further you stray from the
resonant freq.(lowest VSWR) either up or down the higher the VSWR will
get.Anything below channel 1 or above channel 40 is ilegal anyway.AGAIN
you can operate LSB or USB and your VSWR will be the same as it is on AM
as long as you stay on the same channel(1-40).Get your advice from
someone who knows at least the basics,this guy doesn't even seem to know
what SSB is.

Well it sounds like the one I have in an older version indeed. Being that it has
a
few lit switches and a wood grain face along with a wood grain case. Damn, I
would
expect that he probably does not have any of the left over switches from the older
models...........I will keep my eyes out to see what I can run across around
here,
it may take a while but I am bound to find one eventually.....

Hey thank you very much for your input, it was very helpful !

Heard about 1/2 hr broadcast on channel 31
here in the PDX area (Oregon) two nights ago.
Had spoofs of President Clinton and old Saturday
Night live skits. Signal was ok, but occasional
skip stepped on the signal.

The tred in growing! I can see why some pirates
are turning to the CB band for their broadcasts. With
the increased enforcement of the FCC, it makes more
sense to move to a band that is not full of commercial
stations whining about the micro-power pirates.

Do yourself a few experiments with a current meter and raising the voltage to your new 32 pill and you to will see what I have seen in numerous experiments.

```

This power chart above does not show power loss.
It shows power reflected. The power that is lost comes
from only line attenuation. Line attenuation from the
original journey to the antenna, and subsequent line
attenuation of the reflected and re-reflected waves.

Contrary to what is being stated by some, the reflected
power is not dissipated in the transmitter. It eventually,
minus line attenuation, makes its way to the antenna where
it radiates as useful energy. There is not even a need for a
transmatch in order to make use of this reflected power. It will
occur regardless.The transmatches usefulness is only to present
a good load to the transmitter.

Attached is a chart. The horizontal axis shows the original
attenuation of your particular piece of coax. You can figure that
out on your own.
The vertical axis shows additional attenuation in db for a given
SWR ratio.

To make a long story short if you used the top chart to figure the
lost power for piece of lossless transmission line at a 3:1 match, you
would lose 25%
If you used the attached file on a lossless piece of transmission
line the power loss would be ZERO.

Of coarse all transmission lines have attenuation losses. Let's
pick a typical loss. Let's use 1db. With the top chart we would lose
20% of the power from the original journey to the antenna. Then we
would lose another 25% according to the top chart for the 3:1 match.
This means only 60% of our original power makes it to the antenna.
WRONG.
Using the attached chart on the same system we get this. The
original trip to the antenna causes a loss of 1db. Find the 1db loss
on the horizontal axis. Follow it upward to the 3:1 match. Cross over
to the additional loss (vertical axis) of .5 db   This means that 71%
of the original power makes it to the antenna.

I heard on the AM/FM the other day that we are soon to begin a long and strong sun spot cycle. I think they called it Solar Max. Well, if it's any stronger that what I've seen in the past month or so it will be a sight. Most of my rigs have been staying a 8-9+ of Hex during most of the day.

Yes that's right. Tandy UK (Intertan UK) was taken over some while ago by
The Carphone Warehouse Group. Most stores are already coverted to Carphone
warehouse Stores whilst some will change to "Techno" stores, another company
taken over by Carphone Warehouse! Apparently they may not be stocking Radio
Shack product in UK. David

Thanks, I guess I was spacing them 25KHz apart to
reduce QRM!!

I have been hearing a Cuban station on 27.500 A.M. lately. I listen to them on my Rat-Shack DX-390 receiver with a stock antenna in the house. They are DEFINATELY throwing some heat!

Newsgroups: rec.radio.cb

On Wed, 10 Nov 1999 21:54:36 GMT , mad spewed forth to rec.radio.cb:
:md>Well once again you are showing that you don't know a fucking thing.
:md>The Zener action happens when you reverse bias the diode. A standard
:md>diode avalanches at the reverse break over voltage, and its not .7
:md>stupid. a 1N4004 has a reverse break over of 400 volts, but the
:md>forward bias is still .6 to .7. Do you know the difference between
:md>forward and reverse bias? Here's a hint dumb ass, a 16 volt zener
:md>will break over in reverse bias at 16 volts, but guess what when you
:md>forward bias its .6 to .7 volts. Do you have another idea what the
:md>forward break over on a zener diode is? Put a diode across your output
:md>and see what happens. Read up on diodes next time, you don't have a
:md>damn clue. Elementary electronics and you flunked.
:md>Have a nice day, and next time, do a little reading before you spew.

Hey, guess what? Unless you can flip your little diode around 27 million times a second, that RF is going to reverse bias it through half the cycle, and forward bias it through the other half.

Unless you figure out some other way to hook up this circuit, you are not going to have much at all for a waveform.....

Just goes to show that the language used is at about the same level of intellegence as those who use it.

AND TRIM YOUR DARN POSTS!

Who stocks the chrome case covers for Galaxy radios? I have seen them before but cant seem to find them...

Thanks

MC

You are right...  I have found that those kits do not really work as
well as they claim.  It depends on the interference.  I have found that
a good alignment will help most noisy 2950's  I have also tried the
Channel guard.  I found that they are great in 8719 SSB radios.  I put
one in my Demco Satellite as it has NO rejection.  It worked BUT: it
made the the VFo control WAY to touchy.... For some other mods and kits
for 2950's go to www.pantherco.com...

More cb myth, if the swr (singular, not plural) is OK, it is OK for any
mode, (ssb, am, fm, cw, packet, anything). The swr has nothing to do
with what mode you are using.

My first CB came at about 10 it was a Rat shack mobile hooked to a train track power supply and fed into a 7 foot fiberglass stick hung outside the window. You had to be careful with the power supply and only turn it up enough to get the rig to come on or the RX would crap out :)

Oh by the way I think I still have fiberglass splinters in my hands...

Might as well continue. You will Notice that CB really stands for Constantly buying :)

Next came several other Rat shack mobiles and various Cobra CB's that i cant even remember.

Then I got a President 2510. I still have it..

Then a President Washington base. The First 8719 PLL version with the "odd" board. Still have it.

A Cobra 148. Warbled bad on SSB to the point where I sold it in a week..

Grant Xl. Sold it..

Cobra 29 with major mods.. 50+ watts out.. Sold it.

Cobra 25. sold it

Two Cobra 18's. sold them..

Old Uniden PC76. Purchased for $15 to try mods on. That way I could not Mess up anything expensive. Sold it with every possible mod you could do to it and it still worked and put out 54 watts :)

Another 148 but the old style. Sold it.

Cherokee CBS 1000. Sold it..

Cherokee AH 100 handheld. Sold it..

Browning LTD mobile in great shape. Still the loudest radio I have... Incredible audio. I just wish it was cleaner on the Spec-an :) I.E cant run it into an amp as it is Dirty and reflected power is real high...

President George mobile. Still got it

Galaxy 99v. Gave it to a guy so he could give it to his kid for his birthday because he no cash and could not purchase him one..(the kid wanted a Galaxy bad)..

Another 99v to replace that one..

Browning Mark III with Glen VFO. Sold it

Another Browning MKIII with Matching Browning base linear to replace the MK III that I never should have sold. Still have it.

A brand new Robyn T123b in the box. Still have it.

A brand new Johnson Black face brand new in the box. Still have it.

A Demco satelite with all 6 pieces. (transmitter, receiver, Modulator, Speaker, SWR/watt meter, and the 500 watt amp. Still have it.

Yaesu 101ee with Speaker and Freq counter. Still have it..

A Colt Midnight special in perfect condition. Sold it as it was the same as the Robyn.

I am sure I missed a few but you get the idea.

MC

MoisesNY wrote:

> I was just wondering what radio was your first. My radio was back when I hit 14 and my father got me the strangest thing. He got me a Gemtronics 40 channel radio. The Gemtronics, was a big beast. Had tubes in it, but this wasn't that long ago. It was 1979, and they still made this radio. It was great, but being young, I sold it about 6 months later, and put down the money on a new RS TRC 449. Now that was a great radio. AM, and SSB mobile, with a chrome face. Best radio Radio Shack ever made. It was a copy of the 138 GTL, and it was moded from 25 to 30 Mhz. I miss that one too. Well, tell us some stories folks.

My fault...I forgot to add the asking price for the rig. I am asking $575. AES Sells the same rig used for $700 plus.

I have an Icom IC-728 all band, all mode compact hf transceiver for sale. Rig is in like new condition with no scratches, scuffs or blemishes of any kind. Never been mobile.   Rig has optional AM/FM board installed. Comes with power cord, HM-12 up/down hand mic, SM-6 desk mic, full manual and all original boxes and packing. This is GREAT buy. I'm only selling to pay off New Knwd TS-570 SG I just purchased. If serious about buying, email me for photos of the rig.

Buyer pays shipping. Will sell only in Cont. US. You can check out my ebay feedback as user ID rpemers@aol.com.

Thanks,

Ron

Hi folks...

Looking for one or two nice HyGain 623s. While perfect rigs are desirable, exterior condition (lack of dings, front panel wear, etc.) is more important than minor fixable electrical problems.

Please reply also to

wiese@jps.net

as I don't think I always get all newsgroup postings.

Thanks,
Bill

More cb myth, if the swr (singular, not plural) is OK, it is OK for any mode, (ssb, am, fm, cw, packet, anything). The swr has nothing to do with what mode you are using.

This is very well put. The SWR will change when you change frequency. The higher the frequency you go the lower the antenna needs to be. The lower the frequency you go the higher the antenna needs to be. Electronically, your antenna may or may not go to those bands without going over a 2. Nominal SWR is what we all strive for. For band use if your antenna is not "broad banded" and that will definatly depend on the vehicle/antenna marriage, you can use an antenna matcher to tune down your Antenna. This is not something I like to do all the time. The more things you put between your antenna and radio the more risk you run of a failure. So, the answer to the second part of your artical is that you may or may not be able to go 40 up and 40 down safely. You will just have to check the antenna between the frequencies that you are going to use and then determine if it is safe. Otherwise your favorite CB Shop does have parts to fix the malfunction that will happen.

Happy DX'ing.
Boy hope I spelled everything ok. I know the spelling patrol is about. :)

Really?

Page 59, ARRL Solid State Design for the Radio Amateur

(see figure on Page 60, Fig. 27)

A protective measure for unballasted transistors is seen in fig 27. A Zener diode is connected as a peak voltage clamp from collector to ground. Assuming the Max collector voltage will be twice the supply amount (comes out to 24 volts), ZD1 is not part of the circuit. However, should a load mismatch occur, or the stage break into self oscillation, the collector RF voltage will soar to high values. At that point, ZD1 will conduct at 36V and clamp the voltage above that value, thereby protecting the transistor. Furthermore, should voltage spikes occur on the supply line, the zener will clamp at 36 volts or higher, thereby again protecting the transistor. If protection from positive and negative swings is desired, two zeners can be bridged from collector to ground, back-to-back fashion. ARRL lab tests indicate that no degradation in amplifier performance results from use of Zener diodes at hf and mf, provided the diode conduction point is well above the normal RF voltage peak value. No evidence has been found that ZD1 enhances harmonic energy output."

Guess the idiots that do this stuff on a daily basis don't know as much as you and prozac either, eh?

Or could it be that you don't know what you are talking about?

Banded end of the Zener to collector, unbanded straight to ground.

I was wrong in the value. Been a while.

    I don't have a schematic of this radio on hand but let me throw
something your way from memory.
    In those vintage radios, the relay coil was often a 110 vdc
winding. To supply the coil this voltage meant maker had to provide
another winding on the power xformer or tap the hi voltage supply
with resistors to drop the voltage.
    There was another way to get this voltage and I think this is
what you have in front of you.
    What they probably did was use the center tap of the hi volt
xformer. In doing this they use a small value electrolytic cap in
series from the xformer to one side of the relay coil. You will most
likely find a rectifier diode across this cap to give you dc.
    Because the caps impedance is relatively high at the power line
frequency only a small ac voltage is coupled from the xformer.
    Judging by the age of the unit the cap is probably bad and is
not able to supply enough voltage and current to pull the relay in.
In effect the internal resistance of the cap is too high at the
power line frequency to provide sufficient coupling from the
xformers center tap.
    Had you said the relay was chattering I would have suggested
that the cap was ok but the diode was bad.
    Anyway, if you can trace the relay wiring back to an
electrolytic that is connected to the hi voltage center tap then you
could replace this with one of similar ratings and this should cure
the problem.

If you want a small amp that's a better than average performer and well built, get a Silver Streak 175. With 35 peak watts in at 14.5 volts the output is 300 peak watts on a powered, peak-reading meter into a purely resistive 50 ohm dummy load. The unit is very small (5.25"W X 2H X 5.5"L) for the amount of power it produces. It uses a radial (wrap-around) heatsink and has an electrical outlet for a fan on the rear panel. It uses a pair of SD1446s and comes with a mounting bracket. The downsides are that it's unbiased (will sound a little crunchy on SSB especially if the input signal is light) and it has the sometimes irritating full-time SSB delay. The SSB delay on this unit is quite a bit shorter than the one on the Blue Face 225s and shouldn't bother the majority of users.

I hope this helps.

    The optimum radiation angle depends on where you want to talk.
It's very much like a billiard shot when you think of the ionosphere
as one of the bumpers. I find that a higher angle of radiation seems
to work best for me for skip but that depends on where you are in
relation to the other stations and the height of the ionoshere at
your particular time of day. Whatever works for you.
    Everything at RF is a trade-off in one way or another.
                                    BobC

Yes. Sludgehammer has a monster on his crank on his old Suburban.   I have yet to see his new ride.

One of the DaveMade AC vehicles in Memphis last year also had a 14 or 15 inch Billet crank on his.

I will try to get some pics this year.

Size does matter......how to trim your coax for best performance.

Guess what? Mobile antennas are not 50 Ohms! Honest injun. Because of this, coaxial cable acts as an impedance transformer. So if it is anything other than an electric half wave (or even multiple thereof) the reading you take with your 50 Ohm VSWR meter at the radio end will be erroneous. This is not conjecture and I will not answer anyone challenging this premise.

There is an article in the latest MRT magazine that talks about the easiest way I know of trimming your coax for best performance with a mobile antenna - specifically quarter wave antennas. I'll translate how to do it for CB radio. You'll need a radio, a VSWR meter, 50 Ohm dummy load & a PL259 "T" connector. Attach the radio to the input of the meter - no magic here. Attach the "T" to the output of the meter. Put the 50 Ohm dummy load on one output of the T. Attach a PL259 connector to your coax and screw this into the other output of the T. The coax should be unterminated, that is, NOTHING attached to the end. Key up the radio, set your forward calibration, flick to reflected. Prune the coax until the reflected power drops to nothing. I suggest trimming off about 1/4" at a time. At every electrical half wave length of coax the VSWR will drop to 1:1. (This could be handy if you need more than say a 12ft run.) Take the cable off of the T, strip it back and solder, or screw on, to your mount. When your antenna is perfectly tuned it will measure an SWR of about 1.3:1 - this is totally normal, and totally acceptable.

That's it!

Phase those twin truckers!

Now it gets a little complicated....... if you wanted to prune a phasing harness for two mobile whips you could use a similar trick. Except this time instead of leaving the coax unterminated you'll have to terminate it with a 37 Ohm resistor every time you trim a little off. Make sure the lead lengths on the 37 Ohm resistor are nice and short. A 1W resistor could work here - just give it really short blasts on the Tx (or use a radio with 1W output). Make sure the resistor is not wirewound otherwise you are wasting your time! Also, the dummy load on the T will become 100 Ohms from the 50 Ohms used above. Thankfully, you only have to do this prune, clip and measure repetition once. Then you can just trim the other half of the harness to the same length. Oh yeah, it would be wise to use 75 Ohm coax here (for reason I'll explain if anyone cares to know).

Phase those two Super Big Guns!
Same as above but change the the terminating resistor to 50 Ohms.Once again, 75 Ohm coax works good here. RG-6 isn't too bad. The maximum gain from co-phasing, or stacking, two beam antennas is when they are EXACTLY 0.95 of a wavelength apart - that's a physical wavelength, not an electrical one. Once again this isn't conjecture, it's the truth.

Phase two sets of Super Big Guns.
This is actually easy. Do the above procedure but cut six lengths of 75 Ohm cable instead of just two. Phase the first two beams with two leads, then the second set of beams with two more pieces of coax. Use the two left over pieces to join the two sets together. Having trouble envisioning this? It will look like a pyramid. I'll try and draw it here. If it gets distorted try viewing it in a "reply to" window.

```
H-------
            I
            I---------
            I            I
H-------            I
                         I==================RADIO
H-------            I
            I            I
            I---------
            I
H-------
```

The "=" signs are the coax to the radio and can be any length. The "-" signs are your six pieces of cut coax and are all identical lengths. You can terminate each with PL259 and then use three T connectors.

The same procedure can be used for co-phasing 8 or 16 antennas - although you may find that you'll have to go to electrical full-wavelengths on some of the leads to reach all those antennas. BTW, the most obscene array of cophased multiple-element beam antennas this author has seen are 16 and these were used for meteor-trail communications.

Oh yeah, it is probably worthwhile to tune up each beam independantly with an electrical half-wave (or even multiple thereof) of coax (see first paragraph) before putting the entire contrivance together. There is absolutely no reason on gawds green earth that the beam antennas should have anything less than a 1:1 VSWR if they are indeed designed properly. Oh yes, be sure to wait for a snowy, windy day to install this behemoth.

Hope someone benefits from all this typing.

Greetings!

Via voltage.

Thru a bridge network. The forward, or current detected flowing in one direction, is used as the reference thru which currents detected flowing in another direction, are passed thru the bridge and this calibrated reference to display on the meter.

A Moni-match is about the complexity of these SWR meters. Very simple and only can detect stronger currents.

I'm not kidding when I say that part of the fooling of the SWR meter, arrives from the method of detection used.

Hear [or read;-], me out on this one...

Most SWR meter use two conductors spaced [some are single] evenly with the center conductor pass-thru. Allowing the field to remain thru the center wire, and conduct a field equally into sensor wires without direct connection. Ground, or shield passes thru a series of pass thru wires arranged radially or via a series of plates around the center and sensors - past the sensors. Like a Faraday shield.

Some of the simpler ones use PCB board with etched foil spacing and a slight inductive length to compensate for the conductor spacing and allow for some surface area for field radiation and detection.

How the meter is fooled is done by surface area length used, and sensitivity of components used. Smaller surface areas, or actual length used, are more likely to reside in areas of the standing waves that make the detectors own accuracy difficult.

SWR from long wavelengths are not as easily discerned, and shorter wavelengths are oftentimes reactive and the detector senses both directions at once without good isolation.

Part of the blame lies in the SWR meters own bandwidth. A greater bandwidth does not always equate to same accuracy at any given frequency. What may show up as inductive on one end of the bandwidth spectrum, can show up as capacitive on the other extreme end. A .01 uF cap for RF bypass out of a meter circuit may do fine on low frequencies, but act as a dead short on the high end.

Some high-quality units [read commercial and precision] don't use a diode, they use op amps and are set up like differential amplifiers.

Each type has specific benefits and drawbacks.

One problem, and is a big one, is the pass-thru method of detection and the surface area of the detector parts radiating and the overall ability to provide bandwidth without compromising performance and linear operation through it's frequency range.

As meters get smaller, the method used becomed compromised.

Take a look at a SWR meter section in a Cobra 148 GTL, a piece of coax, and compare that to a typical SWR meter. The GTL one is so small that surface area used to obtain detection cannot supply enough current to saturate the meter to the point of reliable detection. The forward voltage drop across the diode is sometimes greater than the surface area of the detector can obtain enough energy to generate from to pass energy thru the diode. You don't get a reading unless something is absolutely wrong. It hurts performance and accuracy.

Ok folks, don't sell those radios out...I know, I know - anything less than a 2:1 is ok, and these detectors do work for that purpose, unless you're nit-picky pur-sknickety...;-)

One meter I have in my possession uses a Germainium diode and is extremely sensitive. Can be used a grid-dip meter with an external frequency generator - of the type I don't have. It's for LW and SW band use, can't be used for HF or above. Makes an interesting conversation piece, thats about it.

While Dancing with the Mouse on Thu, 11 Nov 1999 09:43:02 -0500, the Modem interrupted with an MNI from "Bob <Bob@bob.com>", and the MotherBoard buffered this to Video RAM:

:+> Hi Andy,
:+>
:+> Let me ask you this, how do most SWR Meters measure SWR?
:+>
:+> Bob.

Regards!
:+> Andy <+:

Greetings!

Via voltage.

Thru a bridge network. The forward, or current detected flowing in one direction, is used as the reference thru which currents detected flowing in another direction, are passed thru the bridge and this calibrated reference to display on the meter.

A Moni-match is about the complexity of these SWR meters. Very simple and only can detect stronger currents.

I'm not kidding when I say that part of the fooling of the SWR meter, arrives from the method of detection used.

Hear [or read;-], me out on this one...

Most SWR meter use two conductors spaced [some are single] evenly with the center conductor pass-thru. Allowing the field to remain thru the center wire, and conduct a field equally into sensor wires without direct connection. Ground, or shield passes thru a series of pass thru wires arranged radially or via a series of plates around the center and sensors - past the sensors. Like a Faraday shield.

Some of the simpler ones use PCB board with etched foil spacing and a slight inductive length to compensate for the conductor spacing and allow for some surface area for field radiation and detection.

How the meter is fooled is done by surface area length used, and sensitivity of components used. Smaller surface areas, or actual length used, are more likely to reside in areas of the standing waves that make the detectors own accuracy difficult.

SWR from long wavelengths are not as easily discerned, and shorter wavelengths are oftentimes reactive and the detector senses both directions at once without good isolation.

Part of the blame lies in the SWR meters own bandwidth. A greater bandwidth does not always equate to same accuracy at any given frequency. What may show up as inductive on one end of the bandwidth spectrum, can show up as capacitive on the other extreme end. A .01 uF cap for RF bypass out of a meter circuit may do fine on low frequencies, but act as a dead short on the high end.

Some high-quality units [read commercial and precision] don't use a diode, they use op amps and are set up like differential amplifiers.

Each type has specific benefits and drawbacks.

One problem, and is a big one, is the pass-thru method of detection and the surface area of the detector parts radiating and the overall ability to provide bandwidth without compromising performance and linear operation through it's frequency range.

As meters get smaller, the method used becomed compromised.

Take a look at a SWR meter section in a Cobra 148 GTL, a piece of coax, and compare that to a typical SWR meter. The GTL one is so small that surface area used to obtain detection cannot supply enough current to saturate the meter to the point of reliable detection. The forward voltage drop across the diode is sometimes greater than the surface area of the detector can obtain enough energy to generate from to pass energy thru the diode. You don't get a reading unless something is absolutely wrong. It hurts performance and accuracy.

Ok folks, don't sell those radios out...I know, I know - anything less than a 2:1 is ok, and these detectors do work for that purpose, unless you're nit-picky pur-sknickety...;-)

One meter I have in my possession uses a Germainium diode and is extremely sensitive. Can be used a grid-dip meter with an external frequency generator - of the type I don't have. It's for LW and SW band use, can't be used for HF or above. Makes an interesting conversation piece, thats about it.

Greetings!

You're getting confused with SSB versus bandwidth.

SSB is a method, or mode of transmission and reception.

Bandwidth is a range of frequencies. You can use SSB in a range of frequencies you select by using the channel and band selector.

Your Lil-Wil antenna is tuned for a low match in the CB band, that band is a range of frequencies. Channel 1 is at 26.965 MHz and Channel 40 is at 27.405 MHz. Channel 19 is at 27.185 MHz for mid-point.

Your radios' band selector allows you to go out of this band and into other ones above and below this CB band.

SSB is a mode. You can use SSB on a typical CB radio channel. Same applies to Connex too...

The only thing you need to be concerned is the difference in *frequency* you use. SSB is a mode that you can use on any CB frequency [although you might get yelled at for it].

SWR is related to bandwidth. Or what range of frequencies the antenna is tuned for. Mode, is just how you use that frequency, or channel, you select. Channels are the frequencies you use, mode is the way the radio will operate on it.

Single Side Band - is a mode, using a very, very narrow range of audio information that is part of the channel you're on. It's not a whole new frequency. In fact, SSB mode uses just a small part of the channel that AM mode would otherwise hog up.

Yes, a short antenna has less bandwidth, or your ability to use a lot of channels above and below the CB-band will be limited.

You can use SSB on the 40 channel CB band. You can also use this mode above and below on channels you have in the other bands your radio can go to.

The only thing you need to make sure is, that the SWR of the frequency you're on, is low enough not to cause damage.

The Lil-Wil antenna, when properly installed, allows you to use 40 channels above and 40 channels below *in frequency* [don't get in confused with mode] without hurting the radio a bit.

You've got a 1:1 now, so you're fine. If you use the CB band a lot, then stick with the way your antenna is tuned now, and when you need to "get away" from the crowd, just don't go too many bands, above or below. What mode you use doesn't matter.

And BTW - if you were checking your SWR while using SSB. Please don't, it's too confusing! Stick with the AM mode for checking SWR. Then use any mode you wish when you're done checking.

While Dancing with the Mouse on Thu, 11 Nov 1999 05:40:09 GMT, the Modem interrupted with an MNI from "jlascottys@mindspring.com (Master Worm)", and the MotherBoard buffered this to Video RAM:

Greetings!

Good job Toll...I've been reading this whole thread, and I only want
to excersize one caution.

One thing that people don't seem to realize, the potential at the collector, is based upon a zero, or ground reference. The Voltage reference is derived from a mean, or average of the PEP which can never go below zero volts, at collector potential.

By that time, the transistor cuts itself off. But, if you use a chassis that is insulated from board ground, you only receive a portion of the protection you may need.

The second part of the Zener diode paragraph is what really should be used in a floating ground chassis, like Unidens. Dual Diode protection like the MOV used in many power line filters - work in a similar way. This way, stray RF currents that are below ground potential due to the floating nature of the chassis and matching network, are shunted to equalize potentials across the collector and emitter. A floating chassis ground is like neutral at the fusebox, a GFCI detects current that can flow from neutral to ground and vice-versa - and pops. In fact it uses a technique similar to that of what you're describing out of the ARRL HB.

The antennas own ground potential may be different, but that is why the shield of the coax is used to offer some common current potentials to remain at the same reference. Can't always apply to elements insulated from the earth some considerable height above.

Now, if the radio uses a floating chassis, you'd want to rate those Zeners at slightly below the max reverse breakdown voltages.

36 volts at 2 watts is about tops.

100V at 1 watt, Diac or Dual Zener, for direct connection to the output terminal of the SO-239 for *input* protection also helps.

[and is why Varistor Diodes work the way they do on those finals, when chassis potential versus board potential, drops out or goes more negative, the forward base-emitter bias to ground keeps the transistor bias from going overboard on class-AB, until the insul-pad or RF-cap is punctured by an arc, then toast. Clamping speed is also a factor.]

While Dancing with the Mouse on Thu, 11 Nov 1999 17:51:52 -0600, the Modem interrupted with an MNI from ""Toll Free" <tollfree@bigradios.com>", and the MotherBoard buffered this to Video RAM:

:+> Really?
:+>
:+> Page 59, ARRL Solid State Design for the Radio Amateur
:+>
:+> (see figure on Page 60, Fig. 27)

:+> ...[...]... thereby again protecting the transistor. If
:+> protection from positive and negative swings is desired, two zeners can
:+> be bridged from collector to ground, back-to-back fashion. ARRL lab

:+> tests indicate that no degradation in amplifier performance results from
:+> use of Zener diodes at hf and mf, provided the diode conduction point is
:+> well above the normal RF voltage peak value. No evidence has been found
:+> that ZD1 enhances harmonic energy output."

...[...]...

:+> I was wrong in the value. Been a while.

I was beginning to worry about you...;-)

:+> Toll Free

Regards!

Hello Bob:

Your post is absolutely correct...it was that particular cap that was bad!
Another Cam88 owner wrote with exactly the same problem, and had solved it
by changing out the cap. He was able to tell me exactly which one, and it
cured what ailed me! Thanks for your perceptive response, Bob.

Regards,

Cary F.

Yep. And the computer makers (like the company I work for) have spent
millions of dollars correcting the bugs that were created by short
sighted programmers in our company who thought that their code would
only be used for a few years.

There was no "intentional hiding" of the problem. There was a lot of
ignoring the problem until the last minute. Many companies still have
not done anything about the date problem.

There is a lot of hype and hysteria, certainly. But the problem will not
be as great is the doom-sayers are screaming - as the major utilities etc
have been working for a long time to clear up their code/machines. They
have also put backup systems into place to handle any unforseen problems.

Look up "conjugate match".

: Use your formulas and/or Smith chart to find the reflection
: coefficient for a 50 ohm transmission line terminated with
: a 50 ohm impedance.

Better yet - use the Smith chart with a 50 ohm input and a
mismatched output (take your pick). You will find that the
reflected power (except for coax loss) IS re-reflected at
the transmitter.

: > the power from this reduced efficiency has to go somewhere.
: > Guess where that is! Right! Heat in the finals! This is
: > power that never gets into the coax in the first place.
:
: It *is* due to reflected power. It *does* happen. This
: "reduced efficiency" that you describe is the effect of
: power reflected into the transmitter.

Read a text on transmission line theory - rather than going by
popular belief.

Since there is a mismatch at the antenna - the impedance that the
transmitter sees is not 50 ohms. The impedance that it does see
can be calculated by formula. As the design impedance is not
present - the finals cannot operate at designed efficiency.

The end result is the same - the finals get hot. It is just the
mechanism is different than what you would think using simple
logic.

: > reading. This is the "apparent SWR" - and can be radically different
: > than the actual SWR at the meter.
:
: I disagree. Fooled how? Give an example of how the SWR meter would
: be fooled.

For one thing - if the impedance that the meter "sees" is not the design
50 ohms, then it will produce an inaccurate reading.

Second - place the meter at a current or voltage node (depending on the
meter design) and you will again get an inaccurate reading.

It is easy to demonstrate. Place a meter in your transmission line where
there is a mismatch and take a reading. Now add 1/4 wavelength of coax.
When you repeat the reading - you will find that it is different.

This even occurs to some extent on my Bird meters - although not as bad
as with cheap CB SWR meters.

MC 10kW Jesus (bogus@thisdomain.org) wrote:
: Size does matter......how to trim your coax for best performance.
:
: Guess what? Mobile antennas are not 50 Ohms! Honest injun. Because of this,
: coaxial cable acts as an impedance transformer. So if it is anything other
: than an electric half wave (or even multiple thereof) the reading you take
: with your 50 Ohm VSWR meter at the radio end will be erroneous. This is not
: conjecture and I will not answer anyone challenging this premise.

Sorry, son. Regardless of whether you answer or not, you are wrong.
To act as an impedance transformer - the coax would have to be either
higher or lower in impedance than 50 ohms (depending on whether the
antenna impedance was higher or lower than 50 ohms.

Now the impedance that the transmitter sees will vary with coax length,
but that does not mean that the impedance is being transformed. The
mismatch at the antenna will remain the same - no matter what you do
to the 50 ohm coax length.

: There is an article in the latest MRT magazine that talks about the easiest
: way I know of trimming your coax for best performance with a mobile antenna
: - specifically quarter wave antennas. I'll translate how to do it for CB
: radio. You'll need a radio, a VSWR meter, 50 Ohm dummy load & a PL259 "T"
: connector. Attach the radio to the input of the meter - no magic here.
: Attach the "T" to the output of the meter. Put the 50 Ohm dummy load on one
: output of the T. Attach a PL259 connector to your coax and screw this into
: the other output of the T. The coax should be unterminated, that is, NOTHING
: attached to the end. Key up the radio, set your forward calibration, flick
: to reflected. Prune the coax until the reflected power drops to nothing. I
: suggest trimming off about 1/4" at a time. At every electrical half wave
: length of coax the VSWR will drop to 1:1. (This could be handy if you need
: more than say a 12ft run.) Take the cable off of the T, strip it back and
: solder, or screw on, to your mount. When your antenna is perfectly tuned it
: will measure an SWR of about 1.3:1 - this is totally normal, and totally
: acceptable.

So you are turning your coax into an antenna, then trimming it for
resonance. Big deal - that has nothing to do with impedance transformation.

>

i do not really know him well, he modded my cobra 148gtl in the early 90's. from what i remember, jake's was joked about by many cb' ers. i had no problem with him. his prices were a little high.

 i remember 1 time going imto jake's shop, and asking about a mobile power mic for my cb, and then i said thanks for the info and left, as i am halfway to my car, 1 of his employees comes outside with the mic with the wires hanging out, saying i have this almost all wired up for you. i told them i was only asking questions and was not interested and never told them i wanted to purchase one. after that i never went there again.

i wound up getting a superstar 3900 from someone i met on the cb for $250 and peaked, and jake was selling them for $300 not peaked.

i forgot the handle of the person i got my superstar 3900 from, he lived in peekskill, NY. he was a really nice guy, once you got to know him.

The chart is about right for percent reflected power for a given SWR for any transmission line, but the chart does not mention transmission line type and frequency. There is a big difference in loss for various types and versions of transmission lines, and each one has different specs for different frequencies. This should be a hint that the chart is referring to reflected power and not lost power. Terman, Maxwell, and Smith explain this subject in detail in their published works, as well as many other RF engineers.

Wow! That's quite a collection. My own collection of "stuff" has grown
and shrunk over the years, depending on my moods. Throughout the years
my more noteworthy radios have included:

Pace 223 (First rig)
Lafayette Comstat 25 (First base, and with 25 channels)

Realistic TRC 47 SSB mobile (First SSB rig. Had very weak AM modulation)
SBE Cortez
Midland 13-885 SSB base (Traded TRC 47 for it. Was hit by lightning when I got it)
Johnson 5 channel mobile (Became the "bicycle mobile")
Contex 6706 Linear (traded the Bicycle mobile for it)
Tram XL5 SSB mobile. (traded Cortez and Contex for it)
Realistic TRC 152 (First PLL rig. Was also hit by lightning)
Hy-Gain 623 "Utopia" (Real nice audio)
Realistic TRC 458 (Paid $15 at a hamfest for it, non working. Modified the heck out of this rig and used it for many years)
Midland 77-882 mobile
Realistic TRC 459 (Computer base. Interfaced it with a Commodore 64, for some "interesting" fun)
Realistic TRC 490
Siltronix 1011D
Yaesu FT101E
Yaesu FT757
President Jackson
Superstar 360
Superstar 3900
President HR 2510
Ranger RCI 2950
Icom 706
Realistic TRC 451

My current "Vintage collection" includes:
Midland 13-885 (Original from the 70's)
Lafayette Comstat 25 (Original from the 70's)
Another Hy-gain 623
Cobra 135
SBE Trinidad
Cobra 139 XLR
Realistic TRC 30A (3)

Cobra 29 XLR
Lafayette SSB50A

Am always on the lookout for memorable "vintage" base stations from "the day".

A regulated power supply typically regulated by buffering a voltage reference, through high current series pass transistors. If you try to charge a battery, the reverse current that can flow, can cause the pass transistors to short collector to emitter, which will then place the full unregulated voltage at the output.

Most likely your series pass transistor(s) are fried.

It's not a good idea to use a regulated power supply as a battery charger..........

Exactly!

There are definite problems in the computer programs and in the BIOS's of many machines, that cannot handle Y2K. The problem is real, it's just not going to be the "end of civilization as we know it" doom and gloom that some have been preaching. Airplanes are not going to fall from the skies, the power systems will not go off-line, the traffic lights will not go out, elevators will not halt in the middle of floors, dogs and cats will not start living together etc.

The computers at the IRS (And other gov't agencies) on the other hand, may be royally screwed. April 15th 2000 will be interesting......

We have a working HR2510, recently refurbished and in fair condition, but electronically sound.
We also have a very dead President Lincoln, it has no power output, but everything else works. Basically it needs one MRF477, and we are too cheap to fix it when we get them so cheap new.
If you are interested in either one of them let us know.

The locals have tried (with little success) so maybe the DXer's can help:
When you hear the bozo calling himself the "Hokey-Pokey" from "Hokey-Pokey"
Texas on 38/39 LSB, please tell him to turn his echo mike down or OFF, and
quit over driving his ampifier (the distortion is terrible). He thinks we're
just jealous when we tell him.

My first radio was a cobra 29ltd WX classic about 4 years ago. I very
shortly after but my Galaxy Saturn Turbo. I own A couple Galaxy DX99's and a
few RCI 2950's. I must say I love the punch of a cobra 29 but the receive is
very poor. I the dx 99 is a pretty radio but is pretty insatiable as far as
weather goes, and I hate noise toys. Needless to say the 2950 is my favorite
radio. IM the original owner of every thing I own and they are in next to
mint condition.

I would stick to 49 Mhz as you will not get interfered with from a CB
radio.

Hi Andy,

Well, I won't dispute that most SWR meters are junk........
but there is one thing that we need to stress here to the
uneducated - I see a few posts down from some guy
named "MC 10KW Jesus" spreading more misinformation.

Like you said, SWR meters read SWR by reading the ratio of
forward to reflected power. This is what SWR is:

THE RATIO OF FORWARD TO REFLECTED POWER

This ratio is constant AT ALL POINTS on the coax. At the
feedpoint, at the radio, in the middle, 1/4 wave down the coax,
1/2 wave down the coax. Assuming the antenna system
is good (good 50 Ohm coax with good connectors) - the
mismatch is at the antenna feedpoint - where the antennas feedpoint
impedance does not exactly match 50 Ohms. This is where some power
is reflected back down the coax (how much power is reflected depends on
how
far the antennas feedpoint impedance varies from 50 Ohms).

Figuring out SWR is simple, how much power is going down
the coax towards the antenna - and how much is be reflected back
down the coax? What is the ratio between the amount of
power going forward and the power coming back? It's SWR.
The amount of power going down the coax towards the antenna and
the amount being reflected from the feedpoint IS NOT EFFECTED
by the length of the 50 Ohm coax. It's that simple.
You can sample the forward and reflected power at any point
on the coax and the ratio between the two is the same.

Throw out your SWR meter!!! SWR IS NOT EFFECTED
by varying the length of coax (I am strictly speaking about
a 50 Ohm radio into coax with a characteristic impedance of 50 Ohms,
where there isn't any feedline interaction with the antenna, also
feedline loss is minimal - no 500 foot runs of coax).

Now, empirically, most everyone knows that when they change coax length
their crappy SWR meters indicates a different SWR...I think
this is what Handy Andy is trying to say. Although your piece of
crap SWR meter does indicate a different SWR - it is lying.

In actuality, SWR is CONSTANT at any and all points on the coax.

Bob.

Hi All,
Nov.12, 1999

I have a new Ranger RG-66 for sale. I paid $310 for the unit. It is peaked and tweaked. Swings 55 watts, 1.5 watt dead key. It lists for $289.99 on the west coast. It has the freq counter jack on the back of the radio. Microphone jack is on the left side. Mod/Rf button, Rf power control, Roger beep, etc. This radio has not been used, is still in the box, with everything it came with. I am asking for $300 plus shipping and handling, payable by money order or certified check, shipped same day money is received.

Interested parties respond to Jusgd4u@aol.com

Thank you Bill,

Everyone seems to ignore the fact they need to tune their antennas not their damn feedline. He could have accomplished the same effect by using an "antenna" tuner, but I don't think he quite understands what he is really doing.

Bob.

The only time your're going to get DX with 4 watts by anything other than accident is during the peak sunspot cycle which happens what? Like every 11 years or so? Even when there is NO one talking, daytime is nothing but 7 - 8 s-units of static. Late night is about the only time you can even talk locally more than a mile away or so with only 4 watts. People running power here in the US has absolutely nothing to do with the static and spanish speaking skip that rolls in EVERY DAY for hours and hours and hours and is all that can be heard even when sunspots are at a low. Hams can run power, so they didn't mind all of the crap that rolls in from places where the FCC has no control when 11 meters belonged to them exclusively. If they wanted to talk to a neighbor 5 or 10 miles away and had 10 s-units of some senorita from Mexico hollering "hola hola, uno dos thres quatro, quatro quatro, hola hola hola" over and over and over all they had to do was bump it down a notch and bingo, they had comms. However, CBers can't do that (at least not legally). We have to put up with friggin burito eaters plugging our ears and wiping out our comms.

And when DX is actually rolling in from somewhere that we can understand em, it's illegal for us to try to talk to those we can hear, and it's illegal for us to bump it down to be able to talk to the local folks as well. Catch 22. Two rules that combined make it nearly impossible to use 11 meters well unless you stay up late night. To get good comms in the daytime on 11 meters you MUST either run power, or talk DX (if you're lucky enough to get DX in a language you speak).

And as far as the ARRL not having any pull with the FCC. It's only logical. The FCC was about to make a decision that would impact directly on the radio hobby. Giving 11 meters to the general public without any testing requirement. Who would they consult regarding

appropriate rules for such a new radio hobbiest service? Why the ARRL
of course. Probably the largest such group of radio hobiest in
existance (at least in the US anyways.) The ARRL is composed almost
completely of hams who just lost one of their best DX bands. Of
course they're going to try and make it so that CB wont catch on by
suggesting rules that make it as hard as possible to use effectively
without being too obvious about it. If CB didn't catch on and
remained unused they would after a time have a shot at getting the
band back.

>Besides the limit is 12 watts on
> SSB and an SSB signal is more efficient anyway.

Only if ya like havin to constantly tune folks in to defeat the bad
freq drift common on many FCC Type Accepted CB radios.

Actually, it's commonly called the Gore Tax. The first time it was applied, the phone companies itemized it on our phone bills calling an FCC charge for universal connectivity or something like that. Then a few months ago, the FCC decided it wasn't high enough and tacked some more $$$ onto the charge and wrote the new law so that the phone companies couldn't itemize it and in fact forbade them from telling us where the extra charge really came from even if we ask. I listen to various talk radio shows and as a result knew about the upcoming rate hike before it happened. When it happened I called AT&T who was at the time my long distance carrier and asked them why the extra charge. They said that it was to "cover increased costs." When I asked them if those increased costs were from the FCC he refused to comment. So every time you write that check for your long distance bill, there is a minimum 3 dollar charge that is in fact a tax applied by the FCC which they didn't want you to know about. It's supposed to be going toward wiring the schools for the internet. I for one see no purpose behind wiring schools for the internet as long as schools are turning out kids that can't even read. Internet isn't going to do anything toward teaching kids to read that a live teacher can't do.

Only baseless because you don't like it when someone points the finger where it really belongs. You guys for all intents and purposes made the rules we have to live by on CB. The only logical reason why we should have any power limits that hams don't have is because you guys didn't want CB to become popular so that you might get your 11 meter band back.

And don't give me that RF exposure or interferance bullshit. At 11 meters it would require gigawatts to do any harm to any living being. And the only way you'll get any bleedover from the 40 channel CB band on a ham band is if you're on a harmonically resonant frequency, at which point you'll get it even if we only run 1 watt. I don't bleed

on my own stuff, not even my cordless phone since I upgraded it, and I
don't bleed on my neighbors TV or any other electronic gear either.
And rest assured if I ever did I'd hear about it quickly because my
nearest neighbor works for the ABI (Alabama Bureau of Investigations).

it depends on how far you want to talk.
27 mhz has a limit of 4 watts where 49 mhz is limited to 100 mw.
49 mhz's sound quality is better at close range as it is fm but for any
distance over 1/4 mile, i would go for 27 mhz or, at least FRS up to 1 or 2
miles.
good luck.

the only time that you may have a problem on ssb over am is if you have a problem with your antenna that varies your SWR reading with power like dirty connections or bad coax in which case when your power goes up, so can your SWR as ssb is about triple the power of am with a stock radio on voice peaks.
if your antenna is in good shape, your SWR shouldn't change from am to ssb WITHIN THE SAME BAND OF FREQUENCYS.
if your antenna is narrow banded, your SWR will go up, the further you move away from the frequency that it was orginally set for ie; set for cb and used on 10 or 12 meters.
good luck.

I am looking for some help from the radio and amp techs.

I have to replace a choke in my LA900 amp and I am looking for help locating one or for someone that can tell me the value of the choke in question.

The location of the red chokes with the white dot on it is as follows:

The first one is located directly off the first input pad on the radio so239 connection to the board.The other one is located at the large combiner on the output side, just in front of the relay .

I need to get 6 of them.

If you can help, Please respond to me Via. E-mail at: qsk694@aol.com

Thanks for your time

nunya@business.com:
<<The only time your're going to get DX with 4 watts by anything other than accident is during the peak sunspot cycle which happens what? Like every 11 years or so? Even when there is NO one talking, daytime is nothing but 7 - 8 s-units of static. Late night is about the only time you can even talk locally more than a mile away or so with only 4 watts. People running power here in the US has absolutely nothing to do with the static and spanish speaking skip that rolls in EVERY DAY for hours and hours and hours and is all that can be heard even when sunspots are at a low. >>

I the 60's-70's we took the daytime heterodyne as a fact of life and just didn't use our radios except for super-local coms. We waited until sundown when everything was fine. Hm. I guess from your POV we should have run linears huh?

<<<Hams can run power, so they didn't mind all of the crap that rolls in from places where the FCC has no control when 11 meters belonged to them exclusively. If they wanted to talk to a neighbor 5 or 10 miles away and had 10 s-units of some senorita from Mexico hollering "hola hola, uno dos thres quatro, quatro quatro, hola hola hola" over and over and over all they had to do was bump it down a notch and bingo, they had comms. >>>

First of all, I can't say what 11 meters sounded like in the pre-CB era because I wasn't there. But I seriously doubt there was any activity by unlicensed foreign stations if it was an international ham band. I could be wrong here, but I'm willing to bet that the band was not at that time shared with any other service.

Secondly, you have an unrealistic view of how hams operate. You seem to think that the first thing a ham does in the face of interference or tough conditions is to kick on a linear and "run power". As if power solves everything. Truth is, most hams don't even own an amplifier and get by with a barefoot 100 watt transceiver.

Thirdly, it's been posted a million times here and you've probably read it before so I won't bore you again with all the details, but briefly, hams simply were not using 11 meters and when it was shifted to CB they didn't miss it and to this day 99.9 percent of hams could not care less about the 11 meter band and don't hold any grudges about "losing it".

<<<However, CBers can't do that (at least not legally). We have to put up with friggin burito eaters plugging our ears and wiping out our comms.>>>

I find your POV truly disturbing. You are saying that people in South America have no right to their CB radios. But you, an American, do. As if your communications is more important - because it's in English.

<<And when DX is actually rolling in from somewhere that we can understand em, it's illegal for us to try to talk to those we can hear, and it's illegal for us to bump it down to be able to talk to the local folks as well. Catch 22. Two rules that combined make it nearly impossible to use 11 meters well unless you stay up late night. To get good comms in the daytime on 11 meters you MUST either run power, or talk DX (if you're lucky enough to get DX in a language you speak).>>>

Not a good justification for adding more noise and interference to the band and taking away other users right to it.

<<<And as far as the ARRL not having any pull with the FCC. It's only logical. The FCC was about to make a decision that would impact directly on the radio hobby. Giving 11 meters to the general public without any testing requirement. Who would they consult regarding appropriate rules for such a new radio hobbiest service? Why the ARRL of course. Probably the largest such group of radio hobiest in existance (at least in the US anyways.) The ARRL is composed almost completely of hams who just lost one of their best DX bands. Of course they're going to try and make it so that CB wont catch on by suggesting rules that make it as hard as possible to use effectively without being too obvious about it. If CB didn't catch on and remained unused they would after a time have a shot at getting the band back.>>

Paranoid fantasy. The actual facts of how 11 meters came

```
into existence (and how many hams were its first users) have been
posted here a million times. I suggest you look it up.

I have no idea where they are made.... and they are not the same as anything
I've seen......I've sold about 30 units and havn't had the first bit of
trouble yet....plus I use one myself......so it seems to me that they are
going to be some of the better rigs on the market.....
a bit touchy to convert but easy when you get used to them....

******

For all of those who constantly complain about overcrowding on the frequencies between 26.965 - 27.405. For every 10 kc. wide am signal in the band, the same 10 kc will accomodate 3 ssb signals or 2-way contacts. What will it be, 40 channels on am or 292+ channels ssb? Some of you will wonder how this figure was arrived at, this I will be glad to explain!

Be part of the solution, not part of the problem!

Jack

Right on the money with this imformation.  The AB-1 bias circuit that is there
is not even hooked up, but just like the black face units, it goes to ground.

Which is better to use for distance AM or FM? I know SSB is better than both, but I'm just wondering if FM has any advantages over AM. I just got an Eagle Sidewinder which I'm using with an A99. I'm thinking about getting another one for the car so I can use the FM mode on the B or C band for clearer communications between the base and mobile. Thanks.

OK MR. Coax, answer me this, does trimming the feedline affect the SWR of a
endfire array? and what about the phasing? will trimming the coax change the
phasing? IM interested in seeing your answer this. Now we would be taking
readings at the xmtr and this is 50 ohm coax.

X-Admin: news@aol.com

I am selling 29 assorted delay relay tubes. These were included with a bunch of tubes that I recently bought from a retired repair guy. He claimed that these are all new/unused, but have been reboxed into plain white cartons. They appear new, but since my tube hobbyist activities are limited to audio, I have no way to test or verify them, therefore I must sell them "as-is".

I would prefer to sell the whole lot to a single buyer to make things easy, but I will consider breaking the lot up if I can't find a home for the whole pile. The list is at the end of this post.

Please make offers by EMAIL (do not post).

Regards,
Tom Mitchell

Green Dragon wrote:

> And as far as the ARRL not having any pull with the FCC. It's only logical. The FCC was about to make a decision that would impact directly on the radio hobby. Giving 11 meters to the general public without any testing requirement. Who would they consult regarding appropriate rules for such a new radio hobbiest service? Why the ARRL of course. Probably the largest such group of radio hobiest in existance (at least in the US anyways.) The ARRL is composed almost completely of hams who just lost one of their best DX bands. Of course they're going to try and make it so that CB wont catch on by suggesting rules that make it as hard as possible to use effectively without being too obvious about it. If CB didn't catch on and remained unused they would after a time have a shot at getting the band back.

If the ARRL and hams have as much pull with the FCC as you claim, how did they lose the 11-meter band to begin with? Obviously, they didn't have enough pull to prevent the loss of a whole band.

Or, perhaps the ARRL/Hams do have the pull, but really didn't care that much for the 11-meter band? Of course, that would shoot down your argument about imposing limits on CB in an effort to get the band back.

Either way, your argument is wrong. You should try to listen to your arguments a little better before posting. They simply don't make sense.

By the way, why do you keep repeating that the 11-meter band was one of Ham's best DX bands? That is total nonsense. The 20-meter band is, and always has been, the most popular DX band (followed closely by

75/80). I doubt the 11-meter band was even in the top ten.

The MFJ 259b is great-- use mine every day-- highly recommended.........

Now, here is something else to think about over the weekend (I have no computer at home).
What if I told the group here that I have a way to construct an antenna that :

- is tuned with the length of it's transmission line
- is relatively easy and inexpensive to build
- will handle high power
- uses no tuner or transformer
- will cover all 40 cb channels

- is as close to 100% efficient as any antenna you will ever build
- low SWR
- can be designed for ham or cb
- few drawbacks

This is one of the neatest tricks I have ever seen in all my years in radio, but few operators (ham and cb alike) have ever thought about it. It is not for everyone, and it has some drawbacks (you figured that didn't you?). It is not my idea, but it's very simple. This antenna is all I use at home, seven days a week. I am not selling anything, and Monday I will post a website with all the info needed to construct one. Also, I'll list all parts needed and prices from my AES summer 99 catalog.
 Try to figure out how an antenna like this could possibly be, and I'll post all the drawbacks that I can think of Monday morning (11/15/99).
Have a good weekend and 73..........

Agreed. If anything is kicked in, it is a host of filters (narrow,
notch, DSP, etc.). If that does not work, there are always other

frequencies (that frequency will be better another day).

In fact, my big project for next year is a little EME (moonbounce). I'm going to try it with only 100 watts on SSB. I'm hoping a good antenna system (in the design stage now) will make up for the relatively low power. I'll consider more power only if that does not give me the desired results.

I checked a few mod sites and found listings to TRC-501.
Maybe someone will figure it out shortly.

Even if everything you say here is completely honest (and I doubt that), even you would have to admit that this (interference) is not typical for the average person running illegal equipment in the CB band.

Howdy Ice

I've never used the MFJ259B but I have used the Anritsu Site Master. This baby measures return loss from 5MHz to 1.2GHz. It plots these boss lookin' graphs that you can save in the memory. This can be really handy if you are trying out a number of different antennas on a standard antenna mount. It also costs about 20 times what the MFJ does. In my experience MFJ products are pretty low quality. However seeing as VSWR is a voltage ratio I guess it is pretty hard to screw that up. Armed with this tool I would tune the antenna right at the antenna, if possible. I think they are worth about 3 bills and this is probably a good deal.

I think the group is in agreement that a mobile antenna is not a naturally resistive 50 Ohms.
It you do this you are introducing reactance to your antenna system. When you have reactance, capacitive or inductive, you will lose bandwidth. Now before you jump down my throat, I admit this is not a big issue with +some+ users.

I remember when I first learned about this. I just about blew my top. For those people who are getting a bill every month from AT&T and do not want this, call up AT&T and tell them you do not want to be their customer, and you absolutely do not want to receive a bill from them each month. This will put an end to it. The next time your make a long distance phone call you can just use one of those special dialing codes like 10-10-321 and pick whatever long distance carrier you want.

This tax is a total scam.

Universal Service Common Carrier Bureau

Universal Service

What is Universal Service?

This rulemaking was initiated to define the services that will be supported by Federal universal service support mechanisms; define those support mechanisms; and otherwise recommend changes to FCC regulations to implement the universal service directives of the 1996 Act. These directives are intended to promote the availability of quality services at just, reasonable, and affordable rates; increase access to advanced telecommunications services throughout the Nation; advance the availability of such services to all consumers, including those in low income, rural, insular, and high cost areas at rates that are reasonably comparable to those charged in urban areas. In addition, the 1996 Act states that: all providers of telecommunications services should contribute to Federal universal service in some equitable and nondiscriminatory manner; there should be specific, predictable, and sufficient Federal and State mechanisms to preserve and advance universal service; all schools, classrooms, health care providers, and libraries should, generally, have access to advanced telecommunications services; and finally, that the Federal-State Joint Board and the Commission should determine those other principles that, consistent with the 1996 Act, are necessary to protect the public interest.

>up themselves (which can run over 7A DC)
Yes, this area is one I have zero experience in.

I should very much like you to show and explain some of this to me next
time I get a chance to fly out your way.

There's more to this than meets the eye or what the alternator companies
know themselves.
<snip>
>What some of the people running the external rectification systems don't

Well, it's fine to say what ever you want,
but doesn't necessarily make it true. I have
used this method to match an 83" Solarcon
Thunderbolt and am able to cover 3 Mhz of
bandwidth and never see over a 1.7:1 swr.

The feedline ended up being 18 feet of quality S.I.W. RG-8M. This worked the best in my particuliar application as the antenna is mounted on the center roof of my 79 chevy van.

Measurements were made with a MFJ 259B and a Palomar Noise Bridge. Couldn't have gotten any closer if I had wanted to.

Jack

http://www.angelfire.com/az/firecommunications/

P.S. Just ran around the corner and had a nice qso with Papa Sierra 02 in Sydney, Australia on 27.380 lsb. I'd say it's working just fine....

In an RF amp, no.

When you increase the current on the base, the current on the collector increases, also.

This is a law of operation on a transistor. The more you turn on the base, the more the collector will conduct.

Sorry, try again.

The FM band will help you pick up the signals in the noise, but AM signals
you can always go to SSB mode to RX them and get better S/N ratio.

Also, SSB is the best mode for getting the maximum distance.

I beg to differ.

Your site is 100 percent useless... That I agree with.

Bigradios may be nonsensical at times, but it is not useless. I have brought quite a few people into the CB keydown scene with that site, given others who wouldn't otherwise have been "in the know" about them a chance to see what they are like, and exposed still others to something new.

What does your site do?

Tells us about your network of friends... Fine.

Post mods that others have posted on the internet... Who cares.

but atleast the pictures on my site are of my own stuff not
> some stranger at a key down that doesnt even know you exist on this planit

Really?

That is why we have special appreciation trophys from nearly every break we have attended, right?

That is why the clubs have listed us (Shadow and myself) as "special guests" at a couple?

That is why when Shadow and I walk into the Saturday ball, we are announced? (not that we are the only ones, but this is far from the norm)

That is why when I am on the bowl talking, people that run breaks are asking me to come to theirs?

That is why some of the break sponsors are asking us to do web sites for them? And, helping to pay the trip their?

I make nearly every break in the southern region.. I will guarantee to you that I have made more than you in the last year. Their are breaks that we have been to that have never been put on the web site, just because we didn't have the time.

Nearly once a month, I pack my family up and attend one of these functions. I enjoy it, and judging from the hits to my web site WORLDWIDE, so do some others.

In the future, I would ask that you don't bring bigradios.com and your site in the same sentence... Like comparing apples to oranges.

My site covers the events.

Yours covers your friends and yourself.

> or did you have to pay to take them pictures?

Actually, in some cases, it works the other way.

You are an insignificant little crack. I realize that with the last comment made.

I suggest you ask some of the people from Memphis on west about Toll Free and Shadow, and see what they say to you..

Then, ask them about Prozack.

At that point, they will more than likely hang up.

You dickmunch, what the hell is that supposed to mean, What do you do for family fun? sit around waiting for your amp to come, or sit in the driveway with your oldlady and try to figure out how to fit all of those alternator under the hood of that raggly ass firebird? make some since once in a while you dickhole! Man if you really went to the school you say you did then they must of had special ed classes, and you talk like you got loads of money and your shit don't stink, then how come you got a mobile box for a base, and I listened to channel 17 for the hell of it, duck you better go to the pump soon, them boys aint letting you talk! HA HA HA........ what a MUDDUCK, why dont you go argue with your boys on the no name board and get the hell out of here, your to damn smart for us!!!!!!

been
> to one.

Let's see..

You have been to one break.

You have never run anything over 16 pills.

But, you seem to think that you know everything about a linear.

How nice.

An uneducated, inexperienced asshole that can tell the rest of the world how everything works.

If you pack your family up once a month for CB radio you are a
> loser.

Why? My family enjoys some of the breaks, and the ones that the kids don't like, they don't go?

I guess I should be like you, and tell my family (doubtful that you have a wife and kids in the first place, judging from your attitude) that CB radio is not for them, and then I should go to the break by myself!

Of course, if Yummy is going to be their (Concrete Man's better half), maybe I should leave the wife at the house! hehe

Is that the best thing you can come up with for a family event?

No. On top of that, we also take vacations every year, my youngest boy races Methanol running go-carts, my second oldest is getting involved in dirt bikes and my daughter is playing basketball.

I live a very happy life, all my kids enjoy going to the breaks, as well as doing their own thing.

I suggest you get a family before you base on another mans family for doing something they enjoy!

See
> ya around.

What with you only attending one break, I seriously doubt it.

But how can an X-Force now be called a DaveMade when the input network is changed, as well as coming with a proprietary bias circuit in them?

That would mean that all amplifiers are DaveMades...

Or that Dave is a Marko, since they made class C boxes back in the 70s, as did Palomar and a couple other manufacturers.

So, what is the "Real Deal" (is his a Dave box, too.... Since basically anything that is class C is now a DaveMade, even when you change two MAJOR items in them) with this...

Seems like it is time to grow up about the whole thing.

Who really gives a $hit anymore, anyways?

I just had an interesting one at work:

We use IBM AS/400s and older IBM Mainframe computers, with dumb TTY terminals on them.

The software is programmed to have the users change their passwords every 90 days.

When that hit in October, we had a problem. The date of the next password change was in 2000.

As soon as the user changes their password, the computer logs them out, and they have to log back in, only this time, THE PASSWORD WAS EXPIRED, as the computer didn't translate to 2000 correctly, and the software was under the impression that the persons password had expired.

It was very tricky and laborious to get it back up. The programmers are still fixing it... We just disabled the every 90 days (upped it to 120, actually) password change, and business as usual.

These are the kinds of things that will happen.

A quicker way might be to check the base voltage on the any of the big, pass (output) transistors. If the base voltage is normal, the problem is shorted pass transistors. If the base voltage is high, the problem is in the driver transistor or the regulator IC. Measure the base voltage on the driver. If it's normal, the driver is shorted. If the base voltage on the driver is high, the regulator IC is likely to be bad. Unless you have a voltage chart for the regulator, the easiest thing to do is to substitute a known good regulator IC. Most manufacturers provide a socket for the regulator IC in order to facilitate servicing. When you get it working again, chart all the key voltages so it'll be easier to troubleshoot the next time.

--

MC 10kW Jesus wrote:

> You've done broken it. The most common failure of cheap linear power supplies is the output transistors. Yours must be cheap too 'cuz it didn't have any current foldback or crowbar protection circuitry. But before I would go wasting money on new transistors, I would pull them off the heat sink one by one and check for shorting. This is easy with a digital meter. Use a Fluke meter 'cuz all others are made in foreign sweatshops. Flukes are made in good all American sweat shops. Flick your Fluke meter to diode check and probe all three contacts on the transistor each way. That's 6 measurements altogether. 2 of these measurements will read 0.6 on your real' American meter. The other four measurements will read nothing. If you measure anything other than that, the device is damaged and must be replaced. Each output transistor has a porcelain power resistor soldered to the emitter. If any of the transistors were blown, see above, replace all of these porcelain resistors - preferably with the same value and power rating, just in case that wasn't obvious. Some guys don't do this part. These guys end up fixing their power supply many times. Sometimes they realize that the same output transistor keeps blowing, sometimes they don't. Some guys know about current-hogging, some guys don't. Back to our scheduled dissertation....If it wasn't the output transistors it could be one of the transistors driving them. You can test these in the same manner but it'll probably be more difficult 'cuz you'll have to desolder them from the circuit instead of just unscrewing.
>
> If you have ruled out any transistors, it's time to start looking at the regulator. This is almost certainly a MC1723 or equivalent. These are notorious for blowing the input junction inside the chip. Given they cost less than a dollar each, just buy a new one and replace it. Oh yeah, it would be a good idea to get a chip socket so it will be easier to replace next time - and there will be a next time.
>
> If you replace it and it still doesn't regulate......the problem is elsewhere and that is where power supplies start getting unique. Hope this helps. Unplug the unit before you start messing with it otherwise the experience could be shocking.
>
> Frizz wrote:

Almost all radios use the shunt type AMC circuit these days. To find the limiter in a new radio, trace the mic audio line from the radio's mic plug, through the mic gain control (if used), to the main board, and along the main board until you come to a transistor that has one leg in the mic audio signal path and another at ground. More than likely that is the active device in the AMC circuit. Removing it will completely disable the AMC circuit.

I've used this technique a number of times on very new model radios and it always works. The transistor you're looking for is almost always the first one you run into along the mic audio signal path. What that means is that it shouldn't take you very long to find it. I usually have had to do it while the customer was waiting, and I've never had a customer complain about it taking too long. Even if it's the second

```
or third transistor down the line, it shouldn't take you more
than 15 minutes to find it and remove it.

Ok, lets start the nonsense <G>

40 channel * 10 KHz = 400,000 Hz

400,000 Hz / 3 = 133 1/3

If the other sideband could be used at the same time = 166 2/3

If a station is on USB every 3 KHz (skipping the "A" channels)
you can fit 133 conversations on the band.

Example:
CH 19 = 27,185 KHz
3 Khz bandwidth takes you to 27,188 KHz.
Now if your on 27,185 KHz on USB and I'm on 27,188 KHz LSB,
we're on the same frequencies. We'll sound inverted to each
other. The low voice freqs will be high and the high voice
freqs will be low.

Where's the 292?

I read somewhere that the only mode the works for EME is CW due
to fading and libration (the moon vibrates!). Did technology
catch up the moon?

We might as well petition for use of the whole 440 kc of bandwidth between 26.965 - 27.405. 440 kc divided by 3 kc = 146.66. Times 2 = 293.2 channels..................

Bill:
Have you seen one of these "ext. spkr. jack less" pieces of junk ? I've been doing it for over 20 years & never seen trash like this before. It has MINI (very mini) transistors mounted on the FOIL SIDE of the board !!! I ain't gonna take the time & unsolder every one til I find it, because I'm afraid of breaking them , since they are so small. But I like your finding meathod. I sold the guy a used 78 instead & told him to have his wife use it! I may see it again, so I'll try your method IF I see it again. I can usually tell by looking @ it, as to which part it is. I KNOW it is on the foil side, & 1 of those wee little biddy transistors is it--but which one ?
Dave

Even with lsb operation only there would be
from 133 - 146 channels instead of 40 - 45!
A little over 3 times the available bandwidth
compared to exclusively am operation!

I wouldn't worry about interference with R/C cars. Boats I would, aircraft definitely. I used to have a couple R/C aircraft and it's not pretty when someone's transmitter takes a hit from another transmitter or other interference. Fortunately it never happened to me, but I witnessed it a couple times. One was destroyed after it's sudden impact with ground, the other flew off into the wild blue yonder never to be seen again by it's rightful owner. Bad way to lose three or four hundred dollars.

The ham frequencies for R/C are definitely the best way to go. Not too many people use them so you hardly ever have to worry about not being able to fly/drive/boat because someone else is already transmitting on your transmitter's frequency. If I was still into the hobby, that alone would convince me to get a ham license. The club I belonged to had well over a hundred members and on Saturday and Sunday, there was always a big crowd at the field. One guy in the whole club used the ham frequencies. He could fly whenever he wanted.

My math is fine, my fingers aren't! <G> I meant 266 2/3 not 166 2/3.

You cannot occupy the same frequencies with USB and LSB at the same time.

Everyone will have to use either LSB or USB. Read my post again. The part about the speech inversion. You can descramble an inverted speech cordless phone with a WT and an SSB CB.

Try this: (I figure you've got a digital tuned VFO radio)
Find an SSB transmission. If it's USB, increase your freq by 3 KHz, switch to LSB, attempt to tune them in. Go 3 KHz down and switch to USB if they're on LSB. Let me know if you are successful in tuning them in. If your radio has good filters, you won't.

Previous post requote:
>40 channel * 10 KHz = 400,000 Hz
>
>400,000 Hz / 3 = 133 1/3

This would mean that Texas Star is Palomar...

Except the Class C models.... Those would be Prides.

Still doesn't jive. When someone learns, the mentor should be happy they left to make their own product...

ESPECIALLY if they improve upon the design. That means that the mentor made
him into something, rather than taught him how to copy part values.

But who cares.

>

key word here is "didn't". they've obviously haden't learned their lesson with cb. when ups became a threat, they jumped on their minute man horses and tried to come to the rescue there too.
politics were different in the 50's when the cb band was born.
in the last 40 some years the ARRL has had a lot of time to hone it's lobbying skills in congress and the FCC as well as the probability that their numbers have grown somewhat since then with more politically active members also.

>You should try to listen to your
>arguments a little better before posting. They simply don't make sense.

neither did the one posted earlier this week by the ham who threatened the guy with the wrath of the FCC. he asked a question about a linear.
the only problem is that the guy's e-mail address clearly stated that he was in the U.K. clearly out of reach of the FCC.
the last time i checked, the FCC wasn't an arm of interpol. or is the ARRL trying to get that changed too?

>By the way, why do you keep repeating that the 11-meter band was one
>of Ham's best DX bands?

by the way, why do the hams keep repeating their complaints about cb'ers doing dx on cb? jealous?
if 20, 75, and 80 meters is so good, what the hell are all of you doing up here in this, admittedly, no good band? why aren't you down there having all of the fun that we can't possibly have without having us bother you?

Greetings!

You had to spill the beans, play the trump card, let the cat out of the bag, beat it to the punch, describe the ending chapter of a good book on how it ends, be a magician telling the tricks of the trade, secrete the secrets...e&c...

I'm glad to see this type of response from people over the idea...

Dammit! - Er, Gosh Darn It!

I've been playing around with this item [dummy and tee] for about a year now - and I'm currently working on VF using different metals using this trick. Got it from [ulp] an older ARRL article someone photocopied for me.

And this method of parallel, which I tried and liked, is why I received a lot of flames over the topic of impedances that exist on a transmission line.

A key-word? Sweet Spots - meaning the better locations on a vehicle for mounting the antenna due to SWR performance before tuning.

For the circuit can be drawn two ways.

You have a series impedance, and a parallel impedance. Combined, both give you overall, or Characteristic impedance the system appears to have.

The method you describe is more along the lines of parallel impedance, using a 50 ohm load, and a complex impedance of the coax. You simply trim the coax to show close to infinite as possible, and with this ruling of parallel resistance, you only see the 50 ohm load, or close enough to that, once the coax is trimmed to show infinite impedance.

Either way you look at it, an SWR meter in-line with the coax, is more like the series circuit, detection of impedance in series with the coax. The patch cord offers a variable in the length.

The T fitting, referenced to a dummy load, gives you a parallel measurement across a known reference of resistance, at that point on the coax.

What is strange, if not peculiar, about this arrangement, is what you see at the meter between both types of measurements. Both are about equal in length of coax once done, with minor adjustments to length between both series and parallel measured/trimmed types of coax for that particular application. The series one needs the antenna, while the parallel test requires only the mount to be at the antenna's location. The antenna is mounted afterwards.

I'll keep the hints you gave about the Twin-truckers [co-phased], that is a good one to remember.

The part that burns me is, once you've trimmed coax, the antenna needs very little tuning right out of the package. So the seals can remain in place once everything is mounted as per instructions - but alas, the owner looks at it differently...;-)

One strong hint in the favor of trimming technique, is the sheer bandwidth this provides. When you think about the overall lenght used for the whole system, you'll understand why the bandwidth of a system with adaquate ground works the way it does. The longer the antenna, the greater the bandwidth it can provide for tuning, even though the antenna itself is very small. It's not the read bandwidth of the antenna here, it's the overall length and surface area of the system that provides this.

The method I use is a little backwards to your description, the "parallel-type" as I call it. It's for permament-types of mounts where I use the mount as the "fixed" end and the parallel or T-fitting on the trimming side to the radio, with a simple check using the SWR meter in-series afterwards.

To set-up the initial tuning;
With the mounts' connector established and mount installed, I use a "quick, spin-on" PL259 adapter that mates with RG-8X or the smaller RG-58, for trimming the proper length in Semis. The trimming is done at the radios end, and you tune to what the mount sees. When finished, the connector is hand soldered on the trimmed end that goes to the radio. The remaining slack is not a bother to the customer, er - sometimes [another story for later ;-]. Finger cuts from Utility knives not included...

To me, series method is much more effective in using the mounting location as the final determination of SWR. The mounts' own response plays a role as well as the antennas. This way, any errors show up immediately without having to wait until afterwards.

To demonstrate to a customer, and to obtain an idea of how SWR will be affected, I use two types of tools with an SWR meter and a Hand-held "Help" radio with the Motorola adapter. A quick hand clamp for Semis, and a mag-mount with felt, both use 18' of RG-8x. An El-Cheapo Francis or a simple Base-load whip also gives the owner, and myself, an idea of what we're up against.

Personal vehicles? I use the mag-mount at various locations to give the owner an idea of what an antenna would look like on the vehicle at various locations, and also for myself to obtain the lower SWR readings at key locations that I would prefer to mount the antenna at, or at least let the owner choose and select either the mag-mount option [most do] or permament. To be used in or around that area on the vehicle.

As far as choices, some prefer the more exotic [as I call it] Dominators or Penetrators [some just like big coils I guess]. Some like a slim-line appeal of the Francis, but Francis types are tricky and are better off in performance if you trim coax versus the whip to reduce splitting and water-entry due to the fiberglass sheath protecting the coil-wind. Others select Firestik, myself included, but I suggest using a permament mount for them, due to the heavy-solid core and amount of copper on these types.

A few that use Firestik, switch over to a lighter antenna like the Francis once they've learned the lesson of having to chase after the antenna once it's blown off or knocked over on a mag-mount. [Sigh]

Semis pose a different type of problem, it's not looks, but the best location to mount. Almost all prefer mirror side mounts. Not a tough job, but a minute deviation of an inch too close or away from the cab and side pillar, and the SWR can skyrocket. But, once mounted, a piece of electrical tape on the bracket tubing for reference and they can have little problems, or worry, about SWR afterwards. Some need to take it down to switch cabs or shift-workers. Put it right back at the same spot, you're 10-8.

Works quite well and have litterally no complaints. I do a lot of leg work, but if it doesn't have to be re-done, you and the customer are satisfied.

Oh well...Thanks for sharing this...you've helped redeem some of the pain incurred over the flames...

You turkey! LOL! ;-)

Greetings!

[From a buyers point of view]

Well, I like it, but I don't...at least I can't use it for the purposes I thought it can do.

A Faceplate a lot like the 148F or the older [read older] SS Saturns.

I like it for what it can do, it's just not an "everyday" radio for commutes in a noisy mobile.

Some flaws, but then I guess I'm happy with a PC-122. If you techs out there can take a note or two, look at the center portion of the board. You'll see a lot of after assembly re-work due to errors in etching the foil traces and mine must be an early production model. Lots of clips and re-soldering of jumpers to make the radio work [rear portion and at mic-input and at connex board]. A caution for others that are curious about the first-off-the-line reports.

So, what the h*ll am I doing with a radio like this? At least I have one, and these things can work, and hard. But are sensitive to vibration and maybe not a good idea to have something this expensive bouncing around on your dash or floorboards just to tease others with echo or to hear yourself with the talkback.

My main complaint? I just don't like the "oversensitized" receiver that this thing has. Picks up Mouse-Phartz from Europa. Schottky diodes in the ANL and NB - with no ability to toggle just one or the other noise reducers - adds noise on their own, and the feed-forward RF-preamp Varactor tuner is a novel application for such a radio.

RF and AF clipping can make a voice sound a bit different, some audio compression is occuring on this radio. And with the addition of the Connex board as a Mic-preamp, this radio makes me wish others used this type of signal processing for their audio. Things would be a lot different if others use this method. Makes Cobras' ST look tame!

Lots of knobs to play with, converted the clarifier, peaked out the Dual-finals. Is capable of a lot more power that many realize.

It's a lot of radio, but the price to me was too high. The built-in noise toys are embarassing to use in some circles. But is outstanding on SSB performance!

Nice little radio to tinker on, with a big price tag.

Maker? RF Limited.

Same size as a GrantXL/Cobra148 chassis...

Similar to? Galaxy 99 [many of the components in AM mod section use parts and layout like their chassis; M4558 Mic amp and dual 1969 finals, single 2166 driver. Got the thing to work 30 watts AM RMS with forward swing, close to 50 watts on SSB - but gets hot and unstable. Put it away when it washed out the TV...;-]

Greetings!

This still does not address the issues surrounding a system that has radiating signal-loss due to poor ground provided at the mounting location.

This is my beef.

When SWR is changed by trimming length, the coax is part of the antenna, it's not just a feedline anymore.

That is the line in the sand, where I say, "Yes, it does!"

Another facet of this, that no one seems to want to think about, is the fact of using an SWR meter, and swapping out with different lengths of coax, can prove you have a properly operating system. If swapping coax changes SWR, we have a series of problems.

Has anyone ever thought of the lowly ground and it's own problems in working with an element thats always gotta' be on top? Hey! Grounds' got rights too you know!

Theres' two parts to every circuit, and Ground is oftentimes neglected to be accounted for, and a lot of people are left scratching their heads as to why "this thing worked fine at the store! I don't get it!"

Poor Ground? Either by Bad location, or Mounting? You still force the coax to work as part of the antenna, it's an active part of the antenna when you need to trim coax. This pertains to both the element and the working ground it's up [or down] against.

When you have the correct mount, properly mounted at the *best* location, the only problem you will have is how to keep it from rusting.

As said earlier, and I will re-iterate. This debate is not addressing the problems associated with mounting location and proper installation. In a crappy set-up, the coax cannot decouple itself from ground at the antennas location due to physical contraints placed on the antenna by the owners desire to use the antenna at that particular spot versus another ideal location that will allow the owner to use any length of coax to provide for the needs of simple connection.

How many times do I have to explain that?

Once people get a clue that the *reason* a 50 ohm antenna can't present 50 ohms all the time, is due to the working counterpoise not making the element act like it was 50 ohms to begin with.

Coax can provide the means to act as a feedline, or become an active part of the antenna system - period.

If trimming the coax solves the problem, then the owner is at fault for not properly positioning the antenna, mounting the right antenna, and/or using the proper mount for it. They have to settle for what they get!

I'm sure that when you search Deja-news regarding the antenna situations people post about, that I reply to. I'll say pretty much the same thing each time.

"Use what works for you." and "If you need to trim the coax...", or, "if you put your antenna there, you have to settle for what you get."

Now, if both the element and ground were working together, like they should - the SWR debate ends. People just don't understand it when I say "Don't put the antenna there just because it looks cool! Because, your life may depend on it someday."

"What good is a big-$$$ radio running a pretty antenna at a cool location if it don't work worth a crap?"

Now, once the ground an radiator work properly, the coax acts like simple feedline.

It's when ground and the radiator present their own reactances that can't leave just R in the R+/-jX problem - we have a situation that the coax now plays a role in acting as a complex and unterminated cable that throws itself into the R+/-jX problem by acting as an active antenna itself with it's own impedance. This then can be conjugated by trimming itself to meet these other reactances to leave just R.

Whats' so disheartening is this "Trim" crap that arises when someone like myself admits to looking at a problem two ways - Series and Parallel circuit forms.

10KW Jesus is dead on the money for what he describes. I've accomplished the same thing but for different reasons with a totally different premise - effects different metals have on Velocity Factor, or RF conductivity to meet the ideal wave in free space.

From my own experiments with the limited budget I have, I came across testing ideas based upon antenna project books that 10KW is relating to.

I'm merely stating facts that are based upon other experiences and proveable results. 10KW found what William Orr and others have discovered about coax, and active antennas. Baluns and Ununs have a place in RF, without their use, we'd have a lot more problems. Coax plays a dual-role in the everyday Radio Operator. Not only is it a conductor, but can also provide the means to stay on the air versus shut down or folded back because of SWR constraints.

Further down...

While Dancing with the Mouse on Fri, 12 Nov 1999 12:24:00 -0500, the Modem interrupted with an MNI from "Bob <Bob@bob.com>", and the MotherBoard buffered this to Video RAM:

> :+> Hi Andy,
> :+>
> :+> Well, I won't dispute that most SWR meters are junk........
> :+> but there is one thing that we need to stress here to the
> :+> uneducated - I see a few posts down from some guy
> :+> named "MC 10KW Jesus" spreading more misinformation.

I can't believe this...

I came out here to help people, and those same people throw out good ideas because it doesn't "fit the mold".

To tell someone that SWR is *constant and never changes* is not the answer to the question of "Why trimming coax changes SWR?".

The answer is simple...

The coax, by it's design, becomes an active part of the antenna system when the center and shield currents present, are not allowed to meet the antennas own impedance at the feedpoint connection. The coaxial impedance and antenna impedance are not equal, energy is not being absorbed by the antenna as a load, it becomes reactive and the coax then reacts to this difference as it offers a complex series of reactances based upon 50 ohms upon itself.

Unless the antenna is tuned, the impedance of the coax will not terminate properly and deliver power to the load equally in both the center and shield conductors.

Power is reflected back and is altered by any or all combination of three different aspects;
One, by the antenna itself and it's reactive response as R+/-jX.
Two, the counterpoise that the antennas driven element works as R+/-jX connection to the shield of an unbalanced cable.
Three, Due to the reactances above, the coax then cannot offer ideal power delivery, so therefore offers is own independent R+/-jX.

These three factors, the first two, driven and the counterpoise [ground] elements form the antennas R+/-jX.

Can be expressed as the antennas own impedance to the coax at the feedpoint.

When coax and antenna do not meet at the same impedance, the coaxial line will then act as a reactance to the radio.

A reflection occurs, or the Standing Wave formed along the coaxial line is not a Conjugate match to either the Radio or Antenna. The coax maintains it's impedance along the line with opposite reactive effects at points along the line that offer Conjugate reactance to oppose the load that the coax is attempting to terminate into.

Unterminated coax offers reactive elements based upon it's impedance along it's length that are frequency dependent.

At these given points, unterminated, or the unbalanced character of coax, offers Inductive or Capacitive reactances, R-/+jX that can be used for conjugate matching of a load to the transmission line.

To arrive to a Conjugate match, the -jX and +jX operators the antenna *system* [this includes driven and counterpoise elements] presents to the frequency of interest, can be applied in series and parallel configurations, towards the unterminated coax.

The Coax, offering various levels of -jX and +jX at 50 ohms of both series and parallel impedance configurations, can offer a conjugate match at key regions along the length of the line to cancel out the antennas own operand [+/-jX] leaving only the resistive element of the coax and the antennas own resistive element providing a loss against the standing wave at this termination point.

Basically, the antenna becomes a tuning stub providing a +/-jX at that point along the length of coax, that can cancel out the +/-jX operator the coax has at the feedpoint for reflection of standing waves - allowing for this given length of coax to provide the radio or meter with a standing wave with the impedance of the coax being reflected to the radio.

What I'm saying here is, a bad SWR problem is when the antenna is not radiating efficiently and therefore provides a complex impedance to the coax. The coax then no longer terminates into a load, it reacts.

How it reacts is frequency dependent and due to its inherent impedance of 50 ohms with a wide variety of various Capacitive and Inductive reactances for this impedance, can provide the capacitive or inductive reactance to cancel out the antennas complex impedance but cannot solve for R - or the resistive element of the antenna itself.

With smaller [read shorter] antennas, this R value is small, so therefore a lot of power is wasted by the coax due to the tuning stub bleeding off energy it's attempting to absorb from the coaxs' termination point.

When the value for R in the antenna system is equal to the R impedance [R without -/+jX] of the expected impedance at the termination point, this point becomes a feedpoint to transfer power from the coax to the antenna system. We still do not have a conjugate match, for in order to leave R - both the coax and antenna system operands must cancel out to leave only R. Due to limitations of resistance of wires and mounting insulators and required hardware, the +/-jX operators will remain with smaller values but never abolute zero.

Since R for a 1/4 wave antenna is 36 ohms with a 90 degree perpendicular ground plane surface, some +jX is needed to raise the R value closer to 50 ohms thru the use of extra wire or inductance. The inherent capacitance of coax [-jX] due to spacing of the conductors, can provide the conjugate needed to meet R for both coax and the radios expected impedance load.

Now Quit! Geez!

Next question I have for you...

How do you determine SWR when the meters' own SWR readings vary along the length of coax? At the feedpoint? Just how do we obtain that when we use a mag mount that is sealed?

Go figure?

```
Regards!

Here ya go... When ya can't argue against something you start with the personal attacks. In this case you're calling into question my honesty. I have absolutely no reason to lie on this newsgroup.

That level is typical. The reason you think it isn't is because of the few you hear. I guarantee that for every amp user that is causing problems there are hundreds if not thousands that are not causing trouble. How does that saying go? It only takes one bad apple to ruin the barrell? I'd be extremely surprised if there was a single CB radio in my town that doesn't have at least a small 100 watt kicker. And of those that have more power, they rarely have the need to use more.

It's late night and quiet now (as far as static and such) and we're having a good time on channel 32 here. I just took a poll of the CBers on the channel. Out of 10 cbers talking on the channel now the highest power right now is 7 watts. I'm running the lowest at 2 watts. Now I've asked folks to crank up everything and tell me what it can do. The highest is 4kw, I'm a little lower than half way down the scale at 1.5kw, the lowest is 400 watts. Now we're all back to where we were before. Every CBer on this channel in this local area runs the lowest power they can to get clear comms. Last night, we were all running along about like we are now and this guy named Richard, who happens to be a ham by the way, came on the channel and started trying to wipe out our comms. He was swearing at us, calling us all kinds of disgusting names, talking bad about our lineage. We first attempted to reason with him, to no avail. The next thing we did was start upping the power until we once again had clear comms. If I can find out Richard's call sign I'll probably post it here and on all the ham NG's to make this jackass known to all. From what I've heard listening to my scanner he does the same crap on 2 meters. It's a wonder no one has already reported him for such behavior up there. Now that I think about it, that may be what has happened because I haven't heard him on the scanner in a while now. He can't get his agitation fix up there so he came down here to mess with us.

not to mention the fact that most cb'ers usually don't experiment with antenna farms and usually use commerically made antennas and do their best to get them up, (and out of reach), as high as possible where people and childern won't come in contact with them.

Greetings!

FM give you "capture" - or the stronger FM signal wins - even when AM traffic is high.

Otherwise the biggest benefit is from SSB for DX [I agree].

While Dancing with the Mouse on Fri, 12 Nov 1999 18:59:04 -0600, the Modem interrupted with an MNI from ""Toll Free" <tollfree@bigradios.com>", and the MotherBoard buffered this to Video

```
RAM:

:+> The FM band will help you pick up the signals in the noise, but AM signals
:+> you can always go to SSB mode to RX them and get better S/N ratio.
:+>
:+> Also, SSB is the best mode for getting the maximum distance.

        ******

  Motorola performed extensive tests some time
back and concluded the prolonged exposure to
rf power at 27 mhz (100 watt levels and up)
is quite capable of inducing cancerous tumors
in both the brain and liver.  I personally
know of two people (both past acquaintances)
who ran cb shops who died of cancerous tumors
which were found in both of these organs!  The
tests also concluded that the MTBF of individuals
involved in this type of work is approximately
20 - 30 years....

<<exactly our point. we don't have a whole lot of options and prefer not to choose your ham option so we invent our own.>>

Exactly my point (and I speak only for myself). You invent your own rules. You break existing rules as you see fit. If you deem it necessary to run 4KW, you would run 4KW. If you feel the urge to transmit on frequencies not allocated
to you, you just go ahead and transmit on those frequencies. By the example you set, It's no wonder many hams (and the FCC) see CBers as lawless, untrustworthy, and lacking any sense of accountability for their actions.

Why not go back in the files and find the posts where I provided the near field rf exposure information for 11 meters. You might be surprised by how little is required to place you in some danger, based upon government findings.

<<when you have a ham in charge of enforcement, it's like having a sheriff in a town where most of the residents are hanging from his family tree, or in this case his beam. Outsiders beware! don't piss off any family members or you won't stand a chance.>>

My opinion:

All this business about the ARRL and FCC being "out to get CBers" is a smokescreen for those who are looking for an excuse not to obey any rules.

No one can justify poaching on frequencies that belong to other people. And until the law is changed, they still *do* belong to other people. (See below)

FCC Frequency Band plan

27.430	Business
27.450	Business

You might check Deja.com about this subject. It gets hashed every couple days. The bottom line is this. The antenna is a vehicle/antenna thing. When you change frequencies your SWR will change. I have been installing and tuning antenna's for 4 years. I have done every antenna imaginable. I have not seen any antenna that will stay at a 1:1 SWR consistantly when you change the bands. Its a rare occurance to get it to happen on the regular 40. Put a Magnetic made and mounted antenna on the top of the truck. Tune in the frequency spectrum you want to use and be happy. Otherwise get an antenna matcher, keep a digital swr meter in line and tune your swr to a 1:1 match on the channel you are using.

Good luck.

The mike that you had tried was probably not wired up correctly for that particular radio.   I would definitely check the connector of the original mike first. Also I would check for any loose connections in the coax. Good luck.

Jumpy

Handy:
So what you are saying is that it is NOT a good "truck driver" CB, right ?
Why do you mention a PC-122 ? Just comparing it to one? Is it the SAME
board as the 99 ?
Dave

You wouldn't believe the info i have!...LOL
I was unaware the going to college violates "Biblical Christianity" .
I spent a year at a nice little Lutheran college in Allentown,PA in 80-81
and they NEVER tried to push religion one anyone!
Muhlenburg was nice but Columbia was the best! 3 years of beer, women and
mainframes ! ! ! ! !

Andy,
As usual, your post was well thought out and accurate as well. Missing from your post was the one small thing most people overlook when checking the SWR on an antenna and that is this....The SWR should be read AS CLOSE TO THE ANTENNA AS POSSIBLE! ! !
As this is not always easily done most people will just stick a meter in line where they see fit to put one and this is where the allowances for coax have to come into play.

>
> Poor Ground? Either by Bad location, or Mounting? You still force the coax to work as part of the antenna, it's an active part of the antenna when you need to trim coax. This pertains to both the element and the working ground it's up [or down] against.
>
> When you have the correct mount, properly mounted at the *best* location, the only problem you will have is how to keep it from rusting.
>
> As said earlier, and I will re-iterate. This debate is not addressing the problems associated with mounting location and proper installation. In a crappy set-up, the coax cannot decouple itself from ground at the antennas location due to physical contraints placed on the antenna by the owners desire to use the antenna at that particular spot versus another ideal location that will allow the owner to use any length of coax to provide for the needs of simple connection.
>
> How many times do I have to explain that?
>
> Once people get a clue that the *reason* a 50 ohm antenna can't present 50 ohms all the time, is due to the working counterpoise not making the element act like it was 50 ohms to begin with.
>
> Coax can provide the means to act as a feedline, or become an active part of the antenna system - period.
>
> If trimming the coax solves the problem, then the owner is at fault for not properly positioning the antenna, mounting the right antenna, and/or using the proper mount for it. They have to settle for what they get!
>
> I'm sure that when you search Deja-news regarding the antenna situations people post about, that I reply to. I'll say pretty much the same thing each time.
>
> "Use what works for you." and "If you need to trim the coax...", or, "if you put your antenna there, you have to settle for what you get."
>
> Now, if both the element and ground were working together, like they should - the SWR debate ends. People just don't understand it when I say "Don't put the antenna there just because it looks cool! Because, your life may depend on it someday."
>
> "What good is a big-$$$ radio running a pretty antenna at a cool location if it don't work worth a crap?"

What happened to the days when Dave and Debby knew all there was to know
about Cb radio? Did they get to the part in the Bible that tells of humility
being a virtue?

We are approaching solar max, current guess is that we'll reach peak around the middle of next year. The old sun is already quite the sight.

Has anyone out there heard of a Dak IV (6) mobile 40 channel ssb\am radio? I can't even find a Sams Photofacts reference for this model on the Sams site. This radio seems to be a mystery. I've asked on the ng before if anyone has seen or familiar with this model with no luck.

I've even searched ebay past auctions and there has never been one for sale there either.

Hello everybody,

Who can help me????? I often listen to ssb/usb stations on the 27 mhz For example frequency 27.555
I know every country has his own call sign. (for example: The Netherlands call-sign starts with: 19.

My question to you is: Who can help me by mailing me the complete list of country's and their numbers.

If you have such a list you can mail it to: rwm.music@worldonline.nl

Many, many thanks from Ricardo

Same as the DAK 10, but without the tube modulator and final.

Typical Cybernet chassis.

Toll Free

You ask me to leave you alone.

You send email to my email address, but don't have the common courtesy to reply.

You still talk shit, like you know what you are doing.... But, your ignorance shows with every post you make.

> Toll free you make fun of me because I havent ran bigger then a 16 pil

No, I post what is the truth. You are telling us that you know what will work with a higher power setup, but then admittedly later, you come and say that you have never run anything that large.

How do you KNOW it will work, when you have never done it, and how are you going to argue with people who have "been their, done that" when you haven't done it?

Are
> you saying your first set up was bigger?

4CX10K on the base.

That was my first real setup, being driven by a Johnson Viking Valiant II

In case you didnt realize That was
> my first Amp Set Up.

So?

This 2 drivin 8 driven 32 Pill is my second set up and
> from most people I talk to that is pretty impressive.

Just because you can quote what someone else is running, doesn't make you a big strap.

Like I said... I have yet to hear you or your station, but yet I talk to the big boys in your area on nearly a daily basis. Ask them...

My mext one will most
> likely be a single 3cx15000.

So, your going to go from a 3 K, to a 6K to a 35K?

And not know how any of it works!

Sounds like DaveMade found another idiot that they can keep selling to!

When they say "Stop cryin', and start buyin'", it is only a figure of speech.

>
> Didnt you say you run texas star? Come on what a joke.

A joke in what way?

I get more out of my Texas Star 8 pill than I have seen out of most any other box (Competition or not).

Compared it to a Dave... I get more with less drive
Compared it to a Cookie .I get more with less drive
Compared it to a Pirate ...I get more with less drive.

Just because it says Dave, Cookie, Pirate, Pac Man, Cocaine, etc. on the front doesn't make it the best amp on the market.

My 8 pill does a thousand Bird watts with 35 watts of drive.

Your's won't! And that is with 15.5 to 16 volts on the collectors.

So, who is the joke now? The guy who bought a name, or the guy that can actually build something that works better than the other guy?

on the antenna should be a screw on where the whip stick down to the base load. unscrew it and pull it down in the base load, if the swr's are still not down, saw alittle off the whip to get the antenna to go down farther in the base load. GOOD LUCK

I STILL HAVE MY JOHNSON RADIO'S, IF ANY ONE IS INTERESTED.
PLEASE EMAIL AT CBBOY@AOL.COM. THEY ARE UNTESTED BECAUSE NONE OF THEM HAVE A POWER CORD.BUT YOU CAN MAKE ONE, ALSO I HAVE A COBRA POWER MIC CA-75. BRAND NEW IN THE BOX. $20

HAVE A GOOD DAY!

ok andy check this out. a lot of guys run these suburbans. ok why is it necessary to put a ground strap on every moving part of this vehicle if these parts already have metal attached to them, to wit, the doors, the engine compartment hood, etc. it would seem to me that the fact that these parts of the car are attached, if you will, then rf will find this an adequate ground , but evidentally it doesn't , so i leave it to the distinguished professor of hook ups, ...sir you have the floor,......icm out....
Handy Andy wrote in message <382cf541.10969269@news.iserv.net>...

>Greetings!
>
>This still does not address the issues surrounding a system that has radiating signal-loss due to poor ground provided at the mounting location.
>
>This is my beef.
>
>When SWR is changed by trimming length, the coax is part of the antenna, it's not just a feedline anymore.
>
>That is the line in the sand, where I say, "Yes, it does!"
>
>Another facet of this, that no one seems to want to think about, is the fact of using an SWR meter, and swapping out with different lengths of coax, can prove you have a properly operating system. If swapping coax changes SWR, we have a series of problems.
>
>Has anyone ever thought of the lowly ground and it's own problems in working with an element thats always gotta' be on top? Hey! Grounds' got rights too you know!
>
>Theres' two parts to every circuit, and Ground is oftentimes neglected to be accounted for, and a lot of people are left scratching their heads as to why "this thing worked fine at the store! I don't get it!"
>
>Poor Ground? Either by Bad location, or Mounting? You still force the coax to work as part of the antenna, it's an active part of the antenna when you need to trim coax. This pertains to both the element and the working ground it's up [or down] against.
>
>When you have the correct mount, properly mounted at the *best* location, the only problem you will have is how to keep it from rusting.
>
>As said earlier, and I will re-iterate. This debate is not addressing the problems associated with mounting location and proper installation. In a crappy set-up, the coax cannot decouple itself from ground at the antennas location due to physical contraints placed on the antenna by the owners desire to use the antenna at that particular

>spot versus another ideal location that will allow the owner to use
>any length of coax to provide for the needs of simple connection.
>
>How many times do I have to explain that?
>
>Once people get a clue that the *reason* a 50 ohm antenna can't
>present 50 ohms all the time, is due to the working counterpoise not
>making the element act like it was 50 ohms to begin with.
>
>Coax can provide the means to act as a feedline, or become an active
>part of the antenna system - period.
>
>If trimming the coax solves the problem, then the owner is at fault
>for not properly positioning the antenna, mounting the right antenna,
>and/or using the proper mount for it. They have to settle for what
>they get!
>
>I'm sure that when you search Deja-news regarding the antenna
>situations people post about, that I reply to. I'll say pretty much
>the same thing each time.
>
>"Use what works for you." and "If you need to trim the coax...", or,
>"if you put your antenna there, you have to settle for what you get."
>
>Now, if both the element and ground were working together, like they
>should - the SWR debate ends. People just don't understand it when I
>say "Don't put the antenna there just because it looks cool! Because,
>your life may depend on it someday."
>
>"What good is a big-$$$ radio running a pretty antenna at a cool
>location if it don't work worth a crap?"
>
>Now, once the ground an radiator work properly, the coax acts like
>simple feedline.
>
>It's when ground and the radiator present their own reactances that
>can't leave just R in the R+/-jX problem - we have a situation that
>the coax now plays a role in acting as a complex and unterminated
>cable that throws itself into the R+/-jX problem by acting as an
>active antenna itself with it's own impedance. This then can be
>conjugated by trimming itself to meet these other reactances to leave
>just R.
>
>Whats' so disheartening is this "Trim" crap that arises when someone
>like myself admits to looking at a problem two ways - Series and
>Parallel circuit forms.
>
>10KW Jesus is dead on the money for what he describes. I've
>accomplished the same thing but for different reasons with a totally
>different premise - effects different metals have on Velocity Factor,
>or RF conductivity to meet the ideal wave in free space.
>
>From my own experiments with the limited budget I have, I came across

>testing ideas based upon antenna project books that 10KW is relating
>to.
>
>I'm merely stating facts that are based upon other experiences and
>proveable results. 10KW found what William Orr and others have
>discovered about coax, and active antennas. Baluns and Ununs have a
>place in RF, without their use, we'd have a lot more problems. Coax
>plays a dual-role in the everyday Radio Operator. Not only is it a
>conductor, but can also provide the means to stay on the air versus
>shut down or folded back because of SWR constraints.
>
>Further down...
>

>I came out here to help people, and those same people throw out good
>ideas because it doesn't "fit the mold".
>
>To tell someone that SWR is *constant and never changes* is not the
>answer to the question of "Why trimming coax changes SWR?".
>
>The answer is simple...
>
>The coax, by it's design, becomes an active part of the antenna system
>when the center and shield currents present, are not allowed to meet
>the antennas own impedance at the feedpoint connection. The coaxial
>impedance and antenna impedance are not equal, energy is not being
>absorbed by the antenna as a load, it becomes reactive and the coax
>then reacts to this difference as it offers a complex series of
>reactances based upon 50 ohms upon itself.
>
>Unless the antenna is tuned, the impedance of the coax will not
>terminate properly and deliver power to the load equally in both the
>center and shield conductors.
>
>Power is reflected back and is altered by any or all combination of
>three different aspects;
>One, by the antenna itself and it's reactive response as R+/-jX.
>Two, the counterpoise that the antennas driven element works as R+/-jX
>connection to the shield of an unbalanced cable.
>Three, Due to the reactances above, the coax then cannot offer ideal
>power delivery, so therefore offers is own independent R+/-jX.

>
>These three factors, the first two, driven and the counterpoise
>[ground] elements form the antennas R+/-jX.
>
>Can be expressed as the antennas own impedance to the coax at the
>feedpoint.
>
>When coax and antenna do not meet at the same impedance, the coaxial
>line will then act as a reactance to the radio.
>
>A reflection occurs, or the Standing Wave formed along the coaxial
>line is not a Conjugate match to either the Radio or Antenna. The coax
>maintains it's impedance along the line with opposite reactive effects
>at points along the line that offer Conjugate reactance to oppose the
>load that the coax is attempting to terminate into.
>
>Unterminated coax offers reactive elements based upon it's impedance
>along it's length that are frequency dependent.
>
>At these given points, unterminated, or the unbalanced character of
>coax, offers Inductive or Capacitive reactances, R-/+jX that can be
>used for conjugate matching of a load to the transmission line.
>
>To arrive to a Conjugate match, the -jX and +jX operators the antenna
>*system* [this includes driven and counterpoise elements] presents to
>the frequency of interest, can be applied in series and parallel
>configurations, towards the unterminated coax.
>
>The Coax, offering various levels of -jX and +jX at 50 ohms of both
>series and parallel impedance configurations, can offer a conjugate
>match at key regions along the length of the line to cancel out the
>antennas own operand [+/-jX] leaving only the resistive element of the
>coax and the antennas own resistive element providing a loss against
>the standing wave at this termination point.
>
>Basically, the antenna becomes a tuning stub providing a +/-jX at that
>point along the length of coax, that can cancel out the +/-jX operator
>the coax has at the feedpoint for reflection of standing waves -
>allowing for this given length of coax to provide the radio or meter
>with a standing wave with the impedance of the coax being reflected to
>the radio.
>
>What I'm saying here is, a bad SWR problem is when the antenna is not
>radiating efficiently and therefore provides a complex impedance to
>the coax. The coax then no longer terminates into a load, it reacts.
>
>How it reacts is frequency dependent and due to its inherent impedance
>of 50 ohms with a wide variety of various Capacitive and Inductive
>reactances for this impedance, can provide the capacitive or inductive
>reactance to cancel out the antennas complex impedance but cannot
>solve for R - or the resistive element of the antenna itself.
>
>With smaller [read shorter] antennas, this R value is small, so

```
>therefore a lot of power is wasted by the coax due to the tuning stub
>bleeding off energy it's attempting to absorb from the coaxs'
>termination point.
>
>When the value for R in the antenna system is equal to the R impedance
>[R without -/+jX] of the expected impedance at the termination point,
>this point becomes a feedpoint to transfer power from the coax to the
>antenna system. We still do not have a conjugate match, for in order
>to leave R - both the coax and antenna system operands must cancel out
>to leave only R. Due to limitations of resistance of wires and
>mounting insulators and required hardware, the +/-jX operators will
>remain with smaller values but never abolute zero.
>
>Since R for a 1/4 wave antenna is 36 ohms with a 90 degree
>perpendicular ground plane surface, some +jX is needed to raise the R
>value closer to 50 ohms thru the use of extra wire or inductance. The
>inherent capacitance of coax [-jX] due to spacing of the conductors,
>can provide the conjugate needed to meet R for both coax and the
>radios expected impedance load.
>
>Now Quit! Geez!
>
>Next question I have for you...
>
>How do you determine SWR when the meters' own SWR readings vary along
>the length of coax? At the feedpoint? Just how do we obtain that when
>we use a mag mount that is sealed?
>
>Go figure?
>
>Regards!
>:+> Andy <+:                             |

WHY DON'T PEOPLE GET CAUGHT IF THEY ARE RUNNING POWER. IT SEEMS TO ME LIKE THE
FCC IS NOT DOING THERE JOB. THERE'S A GUY ON THE CB RADIO THAT PUTS OUT 50,000
WATTS, BUT HE CAN'T USE IT CAUSE IT WILL BURN EVERYTHING UP IN HIS HOUSE. HE
EVEN PUTS IT ON 10,000 AND IT STILL BURNS EVERYTHING UP. EVERYBODY NEEDS TO GO
BACK TO USING 5 WATTS OR A LINEAR REAL SMALL  LIKE A 40 WATTER.

   JUST MY OPINION

Toll, is your amp biased.? This would probably be the reason you are using
less drive.
My 8 pill will do 1150-1250 at 15 volts going forward on a bird. I have no
problem with driving it with more watts as long as I get more watts. I run
200 rms into it never tried a 5 pill like some .

That is the smaller of the 15Kw tubes.

The B series tubes are only good for what their plate dissipation is, as
they do not have the current handling capabilities.

If anyone has dreams of competing against a 3CX15KA series tube with that
one, dream on.

The 3CX15KB7 would have a hard time holding it's own with a 4CX5000R tube.

And, that is a little high in price.  You can pick them up at a break for
750 or so, with a guarantee, and sometimes NIB.

> But how can an X-Force now be called a DaveMade when the input network is
> changed, as well as coming with a proprietary bias circuit in them?

Toll, I have seen some of the latest x force dc comp amps last weekend at a
small keydown havent seen any change in the input, daves have been long
acclaimed to have one of the best if not the best input in the business what
could have been changed and what did it improve? Other than possibly a cap
value changes. Are you saying the competition amps now have bias? Maybe
some negative bias is in order. How can adding a bias circuit make it
proprietary?
I have dave amps with negative bias supply, ab-1 for my ssb 3 pill,

> That would mean that all amplifiers are DaveMades...

>
> Who really gives a $hit anymore, anyways?

==
Personally I don't since danny isnt with x force any longer from what i heard. He is with sludgehammer building the Bulldog amps. i guess they are going to be the next best thing since sliced bread.

THIS IS GOING TO BE THE PLACE WHERE I POST ALL TOLL FREES PERSONAL EMAILS IT SEEMS HE MUST SOMTHING TO HIDE:

STARTS HERE:

TOLL IM TELLING YOU

>>>Yes, that is your problem... You like to tell people everything, rather than ask.

IF i RUN A 16 PILL WITH AN M400, I CAN RUN A 32 PILL WITH AN M800.

>>>O.K. Whatever you want to run.

>>>Just doesn't make sense to me to run something that will underdrive your stuff.

>>>You should always strive to run 1 into 4 when it comes to 2879s.

>>>That has been proven to be the best, especially if you are going to run high volts on the pumphouse, and lower or 14 volts on the drivers.

>>>But, don't take my word for it, try it for yourself.

>>>When you don't see the numbers that some of the other guys see, you'l be back at Dennis' house to pick up yet another box!

IM ALSO SAYING IF I CAN RUN A 16 PILL WITH A SINGLE 250A I CAN RUN A 32 PILL WITH THE 250A ALTS.

>>>Whatever floats your boat.

>>>Can you get 6Kw out of your single 250A alternator setup?

>>>If not, then you don't have enough alternator.

>>>Dave's boxes will do it. I have seen it.

THIS SEEMS TO GROOVE WITH CONCRETE MAN

>>>Good. Dennis is telling you what you want to know.... Or is that want to hear?

BUT IT COULD BE POSSIBLE THAT HE IS JUST TRYING TO MAKE THE SALE.

>>>That could be, too. Whatever floats your boat!

HE SEEMS TO BE YOUR IDOL SO WHY NOT ASK HIM?

>>>I have already spoken to Dennis about it once.

>>>BTW, he is far from my idol. He is just another box builder, in a long line.

>>>However, you where the one that originally brought him into this, stating that you where only less than an hour away. That is why I stated anything that had to do with him.

>>>He is someone that can vouch for my credibility when it comes to building and working on this shit we call CB... You wanted someone nearby... How about your builder.

> Toll, is your amp biased.?

>>>No. I use a more efficient input network than "the other guys".

>>>However, you are right. A non-biased amp needs more drive to get the same power output as a biased amp, however, the total saturated power is usually higher from the Class C, non-biased amplifier.

This would probably be the reason you are using
> less drive.

>>>No. I use a more efficient input network than "the other guys".

> My 8 pill will do 1150-1250 at 15 volts going forward on a bird.

Probably tops out at close to 1500 (15-1700?)? That would be my guess.

I have no
> problem with driving it with more watts as long as I get more watts.

>>>That is somewhat of a catch 22, as some of the input power will be fed through to the collector, and out the matching network.

>>>This is the same thing the tubes do... People think when they piledrive a box with mo watts, they are seeing more out... Some of that is feedthrough.

>>>To test for this, you need a meter at the input and output of your box. Measure the increase in output while you increase the input.

>>>You will find a point when you increase the input 100 more watts, the output only increases 90 or so watts.

>>>The other 10 watts is being used to heat up your pills in the big box.

I run
> 200 rms into it never tried a 5 pill like some .

That is a respectable level.

I run a Texas Star 350 into mine (Class C as well, but uses a Texas Star board, and so forth) when I really want to play. 30 watt carrier, swinging up to 150 or so. This will give me nearly 1600 watts Bird, swinging from 1Kw.

The setup I use low drive (read that as around town and general skip talking) keys 300 watts and swings a thousand.

I like forward bump.

I dont give a flying fuck what you say and im sure you feel the same way.

>>>Actually, if I didn't care what you said, I wouldn't respond to you. Their are plenty of people that I ignore on that group.

HEY TOLL IM GLAD YOU CARE?�?�PROZAC SAID THAT

>>>You spread disinformation because you don't know what you are talking about. I correct you. That pisses you off and you get emotional about it.

WHERE IS THE DISINFORMATIOS?�?�PROZAC SAID THAT

>>>Get over it. You don't know everything. Neither do I. I know that I have been building linears for quite some time, have the respect of most every box builder on the keydown circuit, both for AC and DC skills, and that you are a relatively unknown.

>>>What does that tell you?

OH NOW YOU ARE COMMING OUT OF THE CLOSET?�?�PROZAC SAID THAT
I ADMITTED THAT ON THE NEWS GROUP?�?�PROZAC SAID THAT

What you have against me I dont know but Like I said I dont give a flying fuck. I have no reason to lie about anything or make up stories or what ever you think I do.

>>>I don't think that you purposefully lie, make up stories or anything else.

THEN WHY SAY IT?�?�PROZAC SAID THAT

>>>I think that you really don't know what you are talking about, because you have little experience in what you are talking about!

I already told you that I dont know every thing there is to know, I have gone though a shit load of schooling but the way I look at school is as a place to learn how to learn.

>>>That is what grade school and middle school are for.

>>>High school is for you to lay the mathematical foundations for the college level classes you have to take to become someone.

>>>If you are only learning how to learn by the time you are taking ordinary differential equations, then you are about 15 years behind the competition!

It doent matter what you learn it is that fact that you have the ability to lean that the emloyer of today is looking for.

>>>Not my employer! If I told him that I didn't know what I was doing, but I was willing to learn, he would have never hired me.

>>>I make 100+ thousand dollars a year. I usually don't do a damn thing,

either.

WHY DONT I BELIEVE THIS?�?�PROZAC SAID THAT

>>>But, when the shit hits the fan, and MCI has taken an entire office down, and that office loses a quarter of a million dollars or more a day, my boss can send me to Chicago and knows that by the next morning I will have a workaround in place unless MCI gets their shit together and fixes it!

And you know what That is exactly what I have to offer.

>>>Great! Shut your mouth, listen and learn. If you don't agree with something someone posts, I suggest you get a small amplifier, a voltmeter and ammeter and a variable power supply and test it for yourself.

>>>I have done it, and I know what it will do. So have all the other people on the newsgroup that told you that you where wrong.

>>>If you wouldn't have spouted off with all your ranting about how smart you are, what your education level is / was, told us that we didn't know what we where talking about and made an ass out of yourself, you would have earned the respect of the people on it, and they would have taught you things.

>>>At this point, you have a long, uphill climb ahead of you to make people think that you are not just a normal asshole. Sorry, but that is the truth.

YOu know what else an employer looks for? Degree's

>>>No shit.

>>>Guess I am O.K. their.

>>>BSEE, ASM (I double majored in Mathematics and Electrical Engineering), both given by UCSD.

>>>Also, MCSE, CNE / CNA / CNX, A+ and CCNE.

>>>So, I guess I have the diplomas, as well as the certifications to go along with them, huh?

WHY DONT I BELIVE THAT EITHER?�?�PROZAC SAID THAT

do they care that you played around with Multi Meters and read current in your car?

>>>Yes. It shows carefulness and attention to details. I know that I can tell you exactly what is going on in my station at all times. Without that, your half lost.

They dont care how much current is running through your radio shack meter

>>>Radio Shack? Now you are showing your ignorance again. Sorry, all digital meters are made by Fluke, Tektronix makes my scopes, HP my counters and all analog meters and meter movements are Simpson.

in for can sit down do some calculas and prove your theory on paper.

>>>If need be, I can do it all on paper, as well as BEEN THEIR, DONE THAT in the real world.

Have a nice day... I do mean that.

They may be, but his building of plasma genrators, broadcast amplifiers etc must have had some help he was the one who implemented the changes. Perhaps

if you ask ice he will tell you some stories of how some things got designed
/built many years ago. he started modifying tx stars, tnt's hes not much on
reading books. so you could actually say tx star had a big hand in his
experimenting days. Im Out reading the mail.

well i think the bayshore network is got it going on over on the east side
new jersey way, no doubt about it, just needs some refinement and a goal of
what you want to do and you can do it, i think it is a start and at least
someone is trying , so my hat is off to the young blood, so don't worry
about some of these old codgers trying to piss in your cornflakes, do what
you want to do when it comes to cb stuff, and if you don't feel like going
to these 'breaks' as they are called, i got a secret for ya, you ain't
missin much. i will say this much . if i went, i wouldn't tell my
girlfriend, because if she found out i was into this cb nonsense she would
drop me like a bad habit...anyway, i am a secret admirer of the bayshore
network,..........icm out

===
Good guess but depending on the slug I get a legit 1800/1900 on a 2500 slug
and over 2kw on a 10 kw slug.

> >>>That is somewhat of a catch 22, as some of the input power will be fed
> through to the collector, and out the matching network.

I agree again, this happens when sum use a 5 pill to drive a 8 pill or
2/2290's driving a 2 pill.

>

==
I agree also the point of diminishing return, 100 watts more drive and no
amplified return only 100 watts more comig out

I gotta get out to the Bowl old Weed, fla is battling it out with 311 in
florida, 311 has the upper hand as of now they are talking to Mean Pill.
311 is smoking sounds like he is on a base though.

Actually, it's funny that you call yourself ICM.
One of the biggest statiosn outside the "bowl" gamers in the local mixed up
world of Ancint Mary C.B.er's up/down/way over here is "ICM 2000" and is
good friend with the good doctor that makes the house warmers.
When I first joined on and saw the name, I figured you might be him.
Oh yeah.. the good doctor that built the 20kw is rumoured to be working on a
50kw that he is naming "Spike." He calls his 10kw-er's "Clam Bakers." If I
ever meet him I plan to ask him why.

Greetings!

[Hi Dave, good to know you're curious about this radio...]

... Ahhh, but wait, theres' more! ...

Delta Force, a big radio, with a lot of buttons. Fun to play with, but can be dangerously distracting on the road when attempting to use the controls. You gotta' have it right in front of you at times to see the function buttons and set it up right.

It's not a simple radio, but can work like a Grant or Cobra 148 once set. Getting it set or re-set when accidentally bumped, makes this radio dangerous to use in a moving vehicle!

Vertical mounting of the front face, and the sheer weight of parts on the main PCB does create a problem or two with vibration. Had one listener comment about SSB warble, due to the radios weight boucing on the bracket - there seems to be the need for some small revisions to some areas of the board to increase mass for connections.

The "warble" was due to voltage across some junction being affected by vibration, not by regulation. Tapping the main PCB, this shows up. Another fault of "First off the line model".

Speaking of which, I thought this was kinda neat, the board uses a larger regulator that can deliver power to the echo-talkback boards as well as supply the current demands rather well without tremendous amounts of heat. The regulator circuit is simple, doesn't have short circuit protection, but does offer plenty of amperage to supply the board with power.

This would make an excellent base radio, but not an easy one to use in a moving vehicle.

Once you've set the display and tuning controls to what you want, the radio works just like any other CB radio, only a lot louder. Receiver performance is important. If you suffer from engine noise from a previous radio, this is not a miracle cure. But, once above the noise level, the received signals are wonderfully clear and crisp sounding.

The RF gain section needs more work, and AGC with ANL and NB - I found the radio noisier with these functions turned on in some cases than with them off and riding the RF gain control instead.

PCB board gets my vote on being better than Midland or other thinner boards and thickness of copper. Offers better and more solid connections. But this adds weight too. Some spacers on the bottom -foil side- of the board to help dampen vibration may help.

If they [new owners] drive, this radio is a bit complex. Once set, I found the front controls layout pretty good, although the dual gang controls at the clarifier and talkback/echo can be hard to work with when you have fat fingers.

As a benefit, there is a confirmation beep thru the speaker for some functions. To discern the different types, a long or short beep is heard. Not a bad idea, but once again, in a noisy environment you may never hear these tone beeps for keys pressed, and while you're standing still these beeps are annoying as h*ll in volume. Having to hold down a button till it beeps is another annoyance.

A simple radio, like the PC-122 is a lot less complicated for those that drive a lot and use the radio everytime in their vehicle. No confusing dual-gang controls and easy to "find home" versus on the MDF.

The dual gang controls are another one of my beef. The clarifier and talkback on on the same ganged control. Doesn't help with SSB users - touch one, the other control will also operate. Mine has a small "eccentric", read bent shaft, which affected the clarifier then you adjusted the talkback and vice-versa.

Changing bands were also another, as well as using modes and some of the "SHIFT" and "Function" buttons. Hard to remember programming and even harder to choose while driving. A rotary knob is far better to use in driving situations versus a small button, while you're bouncing along. You have to glance at the display all the time to verify where you're at and the mode your on.

Hey, Dave I appreciate you asking the question, I'm just being honest with you. This just isn't a radio for those that can be too easily disracted while driving - too complex to use all it's functions, all while hurling youself down the road. I don't have the time to waste on trying to make a radio like this work when I've got other things to do while on the road. A simpler function radio does the same job and sounds about the same. Although if it's possible, the audio from the MDF would do wonders for any other CB radio.

But when you have time to play, this radio is good for that.

Another neat thing that could be expanded on, is the lighting control.

It has a brushed aluminum faceplate decal on a clear plastic back. If they would only thicken the plastic a little more and offer less aluminum just under or around the knobs, to allow the clear plastic back to work like a fiber optic, the radio will have outstanding nightime illumination which would help a lot of drivers for nightime use. The LCD panel is quite bright at night, even with the dim feature on, and the model I have allows some of the light to pass thru into the front panel knobs so you could at least locate the Echo and Clarifier/Talkback pots if you look just right.

And er, no - not quite the same board. It's just components used in the areas like the final driver sections, and the audio amp sections as well as RX portions of the board, are similar - but layout is different. I'm saying that the operation of these areas, when trouble aises, are to be thought of as those along the 88-99 series for troubleshooting. The component lables are good, but don't follow the Galaxy due to revisions in the numbering of parts. So, what my be D39 on the Galaxy, might be D144 on the MDF.

While Dancing with the Mouse on Sat, 13 Nov 1999 08:44:26 -0500, the Modem interrupted with an MNI from ""Dave or Debby" <truth@planetc.com>", and the MotherBoard buffered this to Video RAM:

:+> Handy:
:+> So what you are saying is that it is NOT a good "truck driver" CB, right ?
:+> Why do you mention a PC-122 ? Just comparing it to one? Is it the SAME

Greetings!

Sounds like a bad switch with the first one - it happens. The other mic, you hear a squeal, so that tells me the Mic is not wired correctly.

There is a difference in models of the 510.

There is the 510e - 5pin - I believe this uses a Condensor mike type
and the 510XL - 4 pin - uses Dynamic element.

Make sure you get the right mike and cord for it.

I beleive the 510e will mate up with a Cobra 19+ [grey key] mic. They both use condesor elements and they get power from the radio in the mike socket.

Unless, since you've got it from a friend and it's a used radio - they may have modified the wiring to accomodate the mike from another radio.

Hope this helps.

They are about the same distance wise. However, because most radio wave
interference is ampitude in origin, FM is alot quieter, and at the
extreme limits of range, this quieter signal can be the difference
between understanding or being understood, or not.

nunya@business.com "Green Dragon" wrote:
<< I guarantee that for every amp user that is causing problems there
are hundreds if not thousands that are not causing trouble. How does that
saying go? It only takes one bad apple to ruin the barrell? I'd be extremely
surprised if there was a single CB radio in my town that doesn't have at least
a small 100 watt kicker. And of those that have more power, they rarely have
the need to use more.>>

Using the minimum amount of power needed to communicate is
considerate of others, and if you honestly subscribe to that idea,
my hat's off to you, sir.

However it seems many 'linear enthusiasts' never turn them
off, simply because they want to be louder than anybody else,
all the time.

Note this post from another current active thread:

Can you get 6Kw out of your single 250A alternator setup?

>>>If not, then you don't have enough alternator.

>>>Dave's boxes will do it. I have seen it.

I dont know where these guys come up with this stuff- Ohms power law does not lie. Power = Volts X Amps. Even if the alternator is doing 18 volts @ 250 amps it is still only is making 4500 watts so how are we doing 6KW. And thats input power- not even output power. No amp is 100% efficient. Id like to meet this guy Dave becasue if he can get more power out of an amp than the power supply is actually dissapating he just found a way to solve the energy crisis! He should be running his own electric company instead of making CB amps! Much more profitable.

Jim

What's up with this????
Don't go blaming Toll for the FCC bull !@#$...... go after Rick Bullon and John John whatever....ski the lame wanna-be-fcc-cops or better known as the Ham Supremacy.

I created that page two years ago and it has been talked about for just as long on Channel 6. I took the locations away so the Ham Supremist's would not bother us. You know, show up with their guns (Like John John wants to do) and Rambo us all away! I have no doubt that the FCC has been to our pages and also there is no doubt in my mind that the FCC has been to our functions a few times. There has never been any damage done because of our web page. If anything, it brought hundreds of people closer together and they made a lot of new friends. So pay attention to what you say and what you accuse someone of before you write.

Those messages sent to the FCC (if they ever were) were all bogus threats and the FCC only would respond with a form letter.   We are not afraid of them. We know the source of their hatred and anger. It is not with us. They are just using us as their scapegoat.

You still want that link to your site on Toll's??????

```

well if you go to scotland be sure and don't go out and get drunk with your
friends and then meet some girls and get a ride home with them, then get in
a sticky situation with them and jump out of the car you are riding in ,
jump over someone's fence and start pounding on their back door at 4:00 am
in the morning, ok. because if you do, you will be shot cause it jus bees
that way sometimes,........icm out..........

I know some that were, and according to them the interferance from south of the border was just as bad on them as it is on us now.

> Secondly, you have an unrealistic view of how hams operate.

You guys consider 100 watts to be barefooted... 'nuff said.

> Thirdly, it's been posted a million times here and you've probably read
> it before so I won't bore you again with all the details, but briefly, hams

Not according to the old timer hams that I've known. It was used a lot for shooting DX because it has more frequent band openings that most other bands.

> I find your POV truly disturbing. You are saying that people in South America
> have no right to their CB radios. But you, an American, do. As if your

> communications is more important - because it's in English.

Heheh... gunna try to twist something around aren't ya? I never said that they didn't have a right to talk. However, they don't have any GREATER right to talk than I do. The problem with them is that they have virtually no restrictions on the amount of power they can run. All I want is to be able to do the same thing you guys do. Run the least amount of power possible for clear comms. Day or night. Here is a brief description of how I and nearly every other CBer I know runs thier equipment. If conditions let me get clear comms with half a watt, great, that's what I use, the amp stays on standby. If conditions require 4 watts, great, I roll the radio up to that point. If conditions require more, I turn on a small driver amp that gets me just a tad more, something like 30 watts PEP. If that's not enough for clear comms I flip that stand by switch and let the 6 pack of 6LF6 tubes to thier thing on the low side. If that's still not enough then we go to the high side. If conditions clean up and it sounds like I can get away with lower power again, then the entire process starts over and I drop wattage as far as I can and still have clear comms. At max power, I can crank 1.5kw out of my stacked threes. And guess what? I rarely have to go that far. It pretty much only happens when we have someone on the channel deliberately trying to disrupt comms. Under the worst natural conditions, I can get by with about 100 watts PEP which I can attain with only my driver on high stage.

> <<And when DX is actually rolling in from somewhere that we can

>
> Not a good justification for adding more noise and interference
> to the band and taking away other users right to it.

If it's good for you guys it's good for us. According to the ham test study book I have even the no-code tech class hams can run 1500 watts on all bands they have rights to if such is needed to get clear comms. I fail to see any difference between that and what the vast majority of CBers who use amps do. Contrary to what you obviously think, not every amp using CBer runs a "splatter box" as I've seen em called in this NG. If I look up at my modulation meter and it's going over into the red it's time to retune my equipment. I've got neighbors who run CB's less than a mile away, and even on the rare occaisions that I run max power they never get any bleedover from me. That's because I like most amp users, run my equipment clean. Stopping all amp usage just because some few morons run amps with several 500Z tubes driven so hard that they throw purple lightning around inside the glass is just as stupid as banning high performance automobiles just because some few morons can't seem to control them and keep wrapping them around trees or other people.

Facts as far as what was made public. Think about it. It's plain human nature. You never miss something until it's gone. Even if as you say 11 meters wasn't used that simple fact of human nature still stands. Look at any one of the millions of children in this country. Give one of them a toy. If he doesn't like it he wont play with it. But let some other child come by and pick it up, the first child will pitch a fit about the other child playing with his toy and will try to take it back. If the parent or person in authority over the children makes the first child let the other one play with the toy he'll cry and whine about it and try to think up ways to get it back without getting in trouble with the authority figure. That's exactly what's been happening between CBers and Hams since 11 meters was allocated for CB.

Dearest Bill

I know I said I wasn't going to respond - but the little guy on my left shoulder with the horns and the pitch-fork keeps encouraging me.....

> Sorry, son. Regardless of whether you answer or not, you are wrong.
> To act as an impedance transformer - the coax would have to be either
> higher or lower in impedance than 50 ohms (depending on whether the
> antenna impedance was higher or lower than 50 ohms.
>

I'm not in disagreement with this at all. I think you are saying the same thing as I am but just a little differently.

>
> Now the impedance that the transmitter sees will vary with coax length,
> but that does not mean that the impedance is being transformed. The
> mismatch at the antenna will remain the same - no matter what you do
> to the 50 ohm coax length.
>

I won't disagree with this either. But insofar as the impedance that the transmitter sees will vary with the length of the coax, it is, in essence, a transformation.

> So you are turning your coax into an antenna, then trimming it for
> resonance. Big deal - that has nothing to do with impedance transformation.
>

Not exactly. You see, when you have an electrical half-wave of coax, it will reflect the load at the other end. In my example, the load will be infinity (or close to it) because the coax is unterminated. Don't forget there is a 50 Ohm dummy load in parallel at the T connector. If you take your parallel resistance formula, Rt=1/(1/R1+1/R2) Apply this to our experiment 1/(1/50+1/inf) [1 over infinity is always 0. If you don't believe me, sub in 99999999etc.or study the exciting life & times of Newton, that's Isaac, not fig] You get 50 Ohms. There is nothing inherently antenna'ish about the coax itself. It is not resonant and all the power is being dissipated in the 50 Ohm load.

You've done broken it. The most common failure of cheap linear power supplies is the output transistors. Yours must be cheap too 'cuz it didn't have any current foldback or crowbar protection circuitry. But before I would go wasting money on new transistors, I would pull them off the heat sink one by one and check for shorting. This is easy with a digital meter. Use a Fluke meter 'cuz all others are made in foreign sweatshops. Flukes are made in good all American sweat shops. Flick your Fluke meter to diode check and probe all three contacts on the transistor each way. That's 6 measurements altogether. 2 of these measurements will read 0.6 on your real' American meter. The other four measurements will read nothing. If you measure anything other than that, the device is damaged and must be replaced. Each output transistor has a porcelain power resistor soldered to the emitter. If any of the transistors were blown, see above, replace all of these porcelain resistors - preferably with the same value and power rating, just in case that wasn't obvious. Some guys don't do this part. These guys end up fixing their power supply many times. Sometimes they realize that the same output transistor keeps blowing, sometimes they don't. Some guys know about current-hogging, some guys don't. Back to our scheduled dissertation....If it wasn't the output transistors it could be one of the transistors driving them. You can test these in the same manner but it'll probably be more difficult 'cuz you'll have to desolder them from the circuit instead of just unscrewing.

If you have ruled out any transistors, it's time to start looking at the regulator. This is almost certainly a MC1723 or equivalent. These are notorious for blowing the input junction inside the chip. Given they cost less than a dollar each, just buy a new one and replace it. Oh yeah, it would be a good idea to get a chip socket so it will be easier to replace next time - and there will be a next time.

If you replace it and it still doesn't regulate......the problem is elsewhere and that is where power supplies start getting unique. Hope this helps. Unplug the unit before you start messing with it otherwise the experience could be shocking.

Frizz wrote:

> Did the dumb thing of hooking up my Diawa PS-50TM to a 7.8volt battery to charge in and now the thing puts out 26 volts instead of 9-12. I hate to have to throw this thing away so does anyone know how to repair it and what to check for? Should I change the variable resistor that changes the voltage? I have checked that with a a multitester and it looks bad. Any other ideas???? Thanks!!!

i don't doubt the truth of this story as i've heard some un-true and out right
false dealings with the florida dept of children and families that were so
outragous as to border on nightmarish.
usually there is at least something, even if it is totally false, that started
the investigation. there is nothing in the article that says why the state
started the investigation in the first place.
i can't draw any conclusions either way on this situation as i don't know the
parents or the states cause of action. it would be interesting to know.
my prayers go with the party that God knows is right.
the parents, if they are right.
the children if the state's right.
and God help the one's that are wrong because, either way, the children are the
only victims regardless of who's right.

Hi
I have three CBs that I want to sell,They are all in working condition they are as follows
1 Midland 40 CH Model 77-104
   Includes Mike
    Condition 6
2 Midland 40 Ch Model 77-145
   Includes Mike and mounting bracket
   Condition 7
3 General Electric 40 Ch Model 3-5806A
   Includes Mike ,Bracket,power cord
   Condition 7
Please make me an offer and also allow for shipping from NY

Thankyou & 73

the fine points of beams arn't exactly my strong suit but here's something to think about.
when you built it, did you use an SO-239 coax connector or connect the coax directly to the radiator elements?
in which ever case, are your coax connections tight enough and secure when you move it from the veritical to the horizontal?
if not, your problem may lie there.
also, when you go to the vertical, does the grounded radiator parallel the mast

or does the hot, (center conductor), one?
if the hot one does and you adjusted the SWR under these circumstances, when you move the hot leg away from the mast, you've just changed the reflective properties of the whole antenna system.
take it for what it's worth and good luck.

it never ceases to amaze me that the ham community ALWAYS make an analogy between people who choose to interpret the FCC rules their own way and total the breakdown of society as a whole as though we were going to cause armagedon to come early but when there is an overly broad statement about the ham community being lumped together as a bunch of holier than thou ass holes, they come out of the wood work and try to distance themselves from each other saying,
"i never said that" or "we all don't agree with that opinion".

where are these not-of -the-same-opinion people when we are called to task for bringing a plague upon the earth?
i probably won't get an answer to this question like i couldn't get an answer to the question i asked 100 times a month ago.

Besides some Clarion and Midland walkies and a Sears Base Station mine was a ten tube Aircastle JE321(which was actually a Courier),that my uncle gave to me in 1972 when I was 15,along with a 9' whip. Both of which I still use today. The whip is mounted on my barn's metal roof. Shelled out $20 for a license in my dad's name, KGZ-8688. Got a Lafayette HB 940 in 1975,and a 3 element beam,later a Navaho 458,a Browning MIV, a ham ticket, a KW 930s,and a bunch of other radios off and on. I still have everything listed above and use it quite often.

well put. i wonder how much of the ham community would rally behind the head of
the FCC if he were replaced by an avid, non-ham cb'er.
i'd bet the entire ham spectrum would fall silent as they would all be in
washington lobbying to have the "bum" thrown out.
when the shoe is on the other foot, it just doesn't seem to fit quite the same.

TOLL FREE PLEASE LET ME KNOW WHERE I SAID I KNOW EVERYTHING ABOUT AMPS? ID LIKE TO READ IT.

I THINK IT IS GREAT YOU DO ALL THAT WITH YOUR FAMILY. I MEAN THE DIRT BIKES AND VACATIONS. But I think CB is a little toy that I play with it isn't a family event for me. You must be a lucky person if you have all this time on your hands. I Have to work 40 hours a week after doing the same at school.

You told me in your Email that you make well over 100,000 a year? Well if you do make that much money and have all that time left to play and still sit here and fight with a total stranger you are really fucking lucky.

Maybe that is what your problem is you take this shit to seriously.
I don't know what you are trying to accomplish by saying I don't know everything because I said it many times already.

How long are going to act like children and keep going in circles? PS how old are you? Not that it really makes a difference but I'd like to think that When I get old I will have better things to do with my life. I just turned 22 and I feel like a retard fighting like this. IM your mind you may think you made me look small and maybe you idols that think you know your shit think you made me look small but you Mean nothing to me.

i think your beanie is too tight.
when you have a ham in charge of enforcement, it's like having a sheriff in a
town where most of the residents are hanging from his family tree, or in this
case his beam.
outsiders beware! don't piss off any family members or you won't stand a
chance.
there are some of us who do believe in the constitution and won't allow our
rights to be walked over like the door mat and the supposed automatic right to
inspections at the first key of a microphone.

>
>What makes the band unusable IS THE CBers running more than 4 watts.

what makes a car unusable on the interstate is when it runs on 2 cylinders.
```

back in the 50's when the band was comparatively quiet, 4 watts wasn't too much of a struggle.
when the band started to get populated, the FCC opened up a whopping 17 more channels in 1978. i agree that the people who use linears can be a problem but the bigger problem lies in the proliferation of cheap cb radio's that anyone can afford.
when the were more complicated and expensive, they were an object for the "upper class" who could afford them. now, they're so cheap, you can pick up one for under $30.00.
it is all of this "air pollution" that causes more problems than all of the amps in use today. this is why people feel the need for 100 watts to just get across the street in some areas. a good analogy to this is light pollution that astronomers suffer when a telescope is built on a dark mountain and 40 years later a bustling city is wrapped around that mountain rendering the telescope usless. you either build a bigger, more powerful telescope or you shut it down.
if the recruting efforts by the arrl and the ham community in general were wildly sucessful and everyone operated WITH A TICKET AND WITHIN THE RULES, you would have the same pile-ups across the spectrum that we have daily in our small 450 khz corner today. you would be tripping over fellow hams all of the time like we do cb'ers but you wouldn't be able to complain because everyone would have their ticket.

>4
>watts is not only enough for what the band was intended for but also
>enough for the ilegal worldwide DXing.

and so was the 23 original channels, IN IT'S DAY. there is a need for change just like there was in 1978.

>Besides the limit is 12 watts on
>SSB and an SSB signal is more efficient anyway.
>

this is true but i think you'll find that if the price of ssb radios were to come down to where am cb's are today, you'll find as much or more congestion on ssb as there is on am today.

Bill Eitner wrote:

> A quicker way might be to check the base voltage on the any of the big, pass (output) transistors. If the base voltage is normal, the problem is shorted pass transistors.

Normal would be about 14.2V. But you'd never see this because we already know the output is way too high. The feedback voltage would also be correspondingly high and, consequently, the drive to the bases of the output transistors would be, well, low.

> If the base voltage is high, the problem is in the driver transistor or the regulator IC. Measure the base voltage on the driver. If it's normal, the driver is shorted. If the base voltage on the driver is high, the regulator IC is likely to be bad.

I disagree. The output transistor(s) could be melted through and the supply rail could in fact be pulling the base up. Seen this before.

> Unless you have a voltage chart for the regulator, the easiest thing to do is to substitute a known good regulator IC. Most manufacturers provide a socket for the regulator IC in order to facilitate servicing. When you get it working again, chart all the key voltages so it'll be easier to troubleshoot the next time.

At the risk of sounding like a hypocrite, I wouldn't attack the unit exactly how I was trying to tell the owner too. This is because I know power supplies like I know women. Well, maybe I know power supplies a little better. I was giving the owner some simple trouble-shooting techniques worthy of trying out before he mule-kicked it across the room. As boring as they may sound, power supplies are an excellent starting point for learning about electronics. They incorporate many concepts that are incredibly useful such as voltage reference, high-gain amplifiers, voltage dividers, current sense, current sources, negative feedback techniques, current amplification, transformers, transient suppression, filtering, bandwidth limiting and power disipation techniques - and that's just linear supplies. Switchers teach you about pulse width modulation techniques, RF suppression and drive requirements at much higher frequecies which is a great starting point for understanding RF circuitry. I got my start in electronics with power supplies and have used the techniques in products that I've designed for myself and the compnay I work for. These include products in the digital, analog, power and RF domains.

get off the pot, boy.
you know that the FCC regs. say that hams can use as much power as nesessary, up to your license limits, to carry on a usable communication and you can't tell me that a large number of hams don't use it to get over high concentrations of atmospheric noise. this is what ham is all about unless you're doing qrp work.

>But I seriously doubt there was any
>activity by unlicensed foreign stations if it was an international
>ham band.

haven't you gotten off the pot yet?
there were / are many countries out there that haven't signed the itu treaties.
"out-band" operations are really nothing new and in those countries, technically don't exist. there, anything goes.
if you ain't been there, you shouldn't assume anything.

>Secondly, you have an unrealistic view of how hams operate.
>You seem to think that the first thing a ham does in the face of
>interference or tough conditions is to kick on a linear and "run power".

again, this is what hams are allowed to do up to your license limits unless
you're running qrp. we don't have this needed luxury.

i find your, (hams), POV disturbing because you act like you have a God given
right to bitch about what we do when you have all of that unused spectrum out
there wasting away and you want to crowd into a little 450 khz space and act
like you own the place.
the people in the latin speaking countries either have no controls on them or
they aren't enforced. we have to put up with all of there crap but you come
here and only bitch at us, not them. even if we do run legal, it ruins our
comms too.

there was a cb'er the other day who asked a question about how to use a linear.
the word linear poked some ham-with-a-badge in the eye and he didn't look any
farther before he started throwing threats at him about the FCC.
the REALLY, REALLY STUPID part of all this was that if the ham had looked at
the guy's e-mail address, he would have seen that the guy was in the U.K. where
the FCC has no reach.
you hams-with-a-badge are so narrow-minded that we need a 1 hz filter or we
loose your message in all the noise that you make.

>Not a good justification for adding more noise and interference
>to the band and taking away other users right to it.
>

another piece of mis-leading information.
you guys get on here and act like we position people all over the country with
amps just to jam the band.
each station is independantly owned and operated. there are some assholes out
there but, i assure you, it is NOT a concerted effort to take away everyones
rights to ust the band.
if ham is so great why are you here?
yes, you have the right to be here but it's begining to sound like you have no
interest in cb other than to use it as a reason to bitch.

>Paranoid fantasy. The actual facts of how 11 meters came
>into existence (and how many hams were its first users) have been
>posted here a million times. I suggest you look it up.
>
by who? hams? i rest my case.
jeff

The same way in which guns are on thier way to being banned. They
weren't paying attention. There were probably groups of hams
(probably those that used 11 meters) who tried to raise a red flag,
just like groups such as the NRA are raising a red flag about guns.
But nobody listened. And the band was lost.
>

back.

If you guys don't care much about the 11 meter band then why the heck
are you on this NG day after day after day preaching about what we do
here?
>
>   Either way, your argument is wrong. You should try to listen to
your

sense.

Typical, just like the anti-gun crowd, you anti-amp-on-cb folks can't
argue your point with logical thought. All you can do is claim that
the logical thoughts of those on the opposing side don't make sense.
>
>   By the way, why do you keep repeating that the 11-meter band was
one

> 75/80). I doubt the 11-meter band was even in the top ten.

I keep saying that because that's what I've been told by some
old-timer hams who were actually there using 11 meters back in the
day. The ones I knew who were around back then have unfortunately
gone silent key since then so even if I knew thier call sign so you
could look it up and get their contact info from the FCC (Which is
another thing I dislike about hams and is why I changed my mind and
decided not to get my ticket. The less the gov't know about me the
better. The fewer gov't databases my name shows up in the better.
Especially ones that are open to the public.) it wouldn't do ya any
good

Mostly because the level of apathy in this country as to what we let the gov't and it's various agencies get away with was very low. Now it's very high. Most people have never even read the Constitution or even understand what it means. I saw a poll once in which people were asked to describe what was in the 1st Amendment. A full 30 % said that it guaranteed freedom from pain. Now days most of the Bill of Rights is ignored by our gov't whenever it suits it's purposes. Look at all the property seizures that happen. I read once about a 60 year old grandmother who had children in Louisana and in Texas. She spent most of her time driving back and forth between the children in her motor home. The DEA noticed how much she drove up and down that route and pulled her over, confiscated her motor home and she didn't get it back until nearly three years later after she had spent almost enough $$$ on lawyers to buy a new one at which time the gov't simply gave it back to her without it ever going to court. By the way, they never found any evidence of drugs. The Constitution protects us from that type of BS, yet the gov't ignores that part because it's inconvenient. The Constitution says that congress must approve ALL taxes placed upon the people by the federal gov't. Yet the FCC taxes us at will without such congressional approval.

I have a Galaxy DX55V that is connected to a K40 3" fiberglass whip with

18' RG-58 coax. On D band channel 1 my SWR's are 1.2 while on channel 40 they are a little above 2. I've tried a 4' whip and also tried a different antenna but my SWR's remain about the same. I'd like to lower my SWR's on the upper channels. Any advice would be greatly appreciated. The rig is installed in my '96 Ford Ranger. I previously had a similar set-up with a Radio Shack CB (I don't remember the model #) and my SWR's were almost non-readable.

The ultimate measure of a man is not where he stands in moments of comfort and convenience, but where he stands at times of challenge and controversy.

yeh , i would suggest a good tower and rotor setup, this is a healthy antenna with switchable polarity, i have one new in stored in my garage. i tried to put it up on a poor man's tower but it didn't work out too good so i took it down and put it in storage, but things change don't you know, so maybe i will take it out and try again, except this time with a rohn tower or some reasonable facsimile thereof. i am impressed about the quality of jo gunn antennas. it would take a lot of abuse to damage these things. they are stout and you can get different gamma matches for whatever power you are thinking about using. i think stock they come with 2000 watt capabilities, not sure on that though, take care and enjoy,......icm out

```

Hi.

I have a Realistic TRC-458 that i have personally used and it has varable key mod done and extra channels with a connex board installed and ready to go...infact when i took it to my cb shop for the yearly tune up i was told that the connex board that is in that radio was the biggest one that he had ever seen. i would rate this one a 8 out of 10.

I also have a Cobra 139XLR with upper and lower channels with the varable key (varable wattage) mod done i would rate this one a 7 out of 10

you make offers.
Please e-mail my friend about this stuff he is the one that wanted me to advertise this stuff. you can e-mail him at b3dude@hotmail.com

I am wanting info on how to tune my own radio. I have a Cobra 29 LTD classic. Not a high dollar guy but don't see any point in paying some guy 50 bucks to do the work when his cost is $1. Am very inclined just don't know where to get the schematics and info that is not too far over my head. thanks.

Only enough power to maintain contact,doesn't say anything about
clear.Often instead of turning up the power switching antennas or modes
does the trick.

Shorten your antenna,and wwhen you talk about band d channel 1 just give
us the freq as some of these radios have 3,5,or more bands.

not to mention if that r/c plane took a nose dive into someones face.
back 35 years ago, my brother hand built an r/c plane on 27 mhz from balsa,
paper and dope from scratch. he put a lot of work into it.
at the time, the rochester ny police used a freq somewhere near 30 mhz.
he was in the park flying his plane when a nearby cop keyed up and his air
plane became a sea plane right into the lake.
needless to say, he was mildly upset.

if all involved would freely agree to this, it would be great.
to try to enforce this would be to form a second elite radio group that would
only serve to divide the cb'ers cause against the holy ham position.
the other problem with this, at least in the U.S., it the fact that the only
reserved or dedicated channel on cb is channel 9. ssb activity above ch 35 is,
by tradition, only and is in no way binding.

>> If you here amers from 27.355mhz through 27.955mhz explain firmly about

>> the
>> agreement and use of these frequencies

it appears that the only people in agreement on this are the sidebanders.
i also enjoy ssb but i also enjoy am dx work on the "quieter" channels.
if a sidebander were to come on and try to "firmly" tell me to go ssb or get
off the frequency, what i would have to say to him would make his antenna look
like a burned out match when i was through with him.

>This is the only way we as
>> sidebanders
>> will have an enjoyable band to communicate on sitting back and allowing
>> it to
>> happen will only mess up the
>upper portion of 11 meters for all of us.
>> 73's and good dxing to all.

as a sidebander, i would like to agree with you. but as one who also enjoys am
dx,
i would have to ask you the same question that i've asked the hams for 2 months
and that is:
who are you to dictate what cb'ers do on the cb band?
none of us own the band nor can we control it's use as this is the relm of the
FCC and the FCC only.
the hams don't control the cb bands and, by the same token, neither do the
sidebanders.
this is not directed to you as much as the original author who ever he may be.
you asked for opinions and this one is mine.
have a good day.
jeff

It's come time to drop a CB into my RV. I've just ordered a Midland
77-115. Looks like a decent radio, nice high-tech look. Now I need to

decide how to set up the antenna. I've read the FAQ but still have a few specific questions. I remember reading a while back that Wilson antennas are a good brand, so I figured I'd go with them. It will be mounted in a '95 GMC conversion camper van with a fiberglass roof. I'd like to bolt the antenna either to one of the front side view mirrors, to the roof rack or the ladder on the rear door. Are any of these positions suitable to give decent reception? The bumper would be fine also. I'm sure I'll have more beginner questions once everything gets hooked up.

Thanks,
David

one thing to be aware of is the fact that, since the 50's, the world picture has changed dramatically.
there are countries that don't exist anymore and, also, there are hundreds of new countries that have cropped up that didn't exist back then either.
a lot of the countries that signed the ITU treaties have "changed hands" and don't subscribe to those restrictions anymore and a lot of the new ones haven't signed those treaties either.
it's akin to the U.S. states each declairing independence from the United States and becomming an individual country unto it's self.
some may abide by the treaty and others may not as, in this case, the original United States government would no longer exist.
how many countries sprouted from the original soviet union or the larger african nations and how many do and don't abide by the treaties?
their political structure is in such a shambles that i would think the ITU would be below the bottom of their list of priorities.
if one were to check into this, i think one would find that by shear numbers, the ITU treaties have pretty much fallen apart mearly by the nature of the world politictical structure today.
members have withdrawn either by attrition, evaporation or by placing important priorities first that really benefit their populations.
just my opinion.

Jeff,
Strangly enough, the "Central Governments" of those so called Banana
Republics do care about 3rd party ITU agreements because they are a
amjor source of revenue. The International Telephone Companies pay the
local telephone company for the use of the telephone lines in their
respective countries for calls originating outside their borders. ITU
is a mjor supporter of somal 3rd world countries and that revenue is
jealously guarded since the local post & telecommunication ministry
usually runs the telephone service. Money talks, BS walks. BTW, most
of these countries really frown upon any 2 way radio comms outside Ham
and then you are not allowed any 3rd party traffic inorder to protect
the revenue source. CBs are unknown in some parts of Africa and
possession of an unregistered radio transmitter is serious business.

Breathe....breathe!
Handy Andy <CodysPC@Iserve.Net> wrote in message =
news:382dad7f.9098439@news.iserv.net...
Greetings!

[Hi Dave, good to know you're curious about this radio...]

... Ahhh, but wait, theres' more! ...

Delta Force, a big radio, with a lot of buttons. Fun to play with, but
can be dangerously distracting on the road when attempting to use the
controls. You gotta' have it right in front of you at times to see the
function buttons and set it up right.

It's not a simple radio, but can work like a Grant or Cobra 148 once
set. Getting it set or re-set when accidentally bumped, makes this
radio dangerous to use in a moving vehicle!

Vertical mounting of the front face, and the sheer weight of parts on the main PCB does create a problem or two with vibration. Had one listener comment about SSB warble, due to the radios weight boucing on the bracket - there seems to be the need for some small revisions to some areas of the board to increase mass for connections.=20

The "warble" was due to voltage across some junction being affected by vibration, not by regulation. Tapping the main PCB, this shows up. Another fault of "First off the line model".=20

Speaking of which, I thought this was kinda neat, the board uses a larger regulator that can deliver power to the echo-talkback boards as well as supply the current demands rather well without tremendous amounts of heat. The regulator circuit is simple, doesn't have short circuit protection, but does offer plenty of amperage to supply the board with power.=20

This would make an excellent base radio, but not an easy one to use in a moving vehicle.

Once you've set the display and tuning controls to what you want, the radio works just like any other CB radio, only a lot louder. Receiver performance is important. If you suffer from engine noise from a previous radio, this is not a miracle cure. But, once above the noise level, the received signals are wonderfully clear and crisp sounding.

The RF gain section needs more work, and AGC with ANL and NB - I found the radio noisier with these functions turned on in some cases than with them off and riding the RF gain control instead.=20

PCB board gets my vote on being better than Midland or other thinner boards and thickness of copper. Offers better and more solid connections. But this adds weight too. Some spacers on the bottom -foil side- of the board to help dampen vibration may help.

If they [new owners] drive, this radio is a bit complex. Once set, I found the front controls layout pretty good, although the dual gang controls at the clarifier and talkback/echo can be hard to work with when you have fat fingers.

As a benefit, there is a confirmation beep thru the speaker for some functions. To discern the different types, a long or short beep is heard. Not a bad idea, but once again, in a noisy environment you may never hear these tone beeps for keys pressed, and while you're standing still these beeps are annoying as h*ll in volume. Having to hold down a button till it beeps is another annoyance.

A simple radio, like the PC-122 is a lot less complicated for those that drive a lot and use the radio everytime in their vehicle. No confusing dual-gang controls and easy to "find home" versus on the MDF.

The dual gang controls are another one of my beef. The clarifier and talkback on on the same ganged control. Doesn't help with SSB users - touch one, the other control will also operate. Mine has a small "eccentric", read bent shaft, which affected the clarifier then you adjusted the talkback and vice-versa.

Changing bands were also another, as well as using modes and some of the "SHIFT" and "Function" buttons. Hard to remember programming and even harder to choose while driving. A rotary knob is far better to use in driving situations versus a small button, while you're bouncing along. You have to glance at the display all the time to verify where you're at and the mode your on.=20

Hey, Dave I appreciate you asking the question, I'm just being honest with you. This just isn't a radio for those that can be too easily disracted while driving - too complex to use all it's functions, all while hurling youself down the road. I don't have the time to waste on trying to make a radio like this work when I've got other things to do while on the road. A simpler function radio does the same job and sounds about the same. Although if it's possible, the audio from the MDF would do wonders for any other CB radio.

But when you have time to play, this radio is good for that.

Another neat thing that could be expanded on, is the lighting control.

It has a brushed aluminum faceplate decal on a clear plastic back. If they would only thicken the plastic a little more and offer less aluminum just under or around the knobs, to allow the clear plastic back to work like a fiber optic, the radio will have outstanding nightime illumination which would help a lot of drivers for nightime use. The LCD panel is quite bright at night, even with the dim feature on, and the model I have allows some of the light to pass thru into the front panel knobs so you could at least locate the Echo and Clarifier/Talkback pots if you look just right.

And er, no - not quite the same board. It's just components used in the areas like the final driver sections, and the audio amp sections as well as RX portions of the board, are similar - but layout is different. I'm saying that the operation of these areas, when trouble aises, are to be thought of as those along the 88-99 series for troubleshooting. The component lables are good, but don't follow the Galaxy due to revisions in the numbering of parts. So, what my be D39 on the Galaxy, might be D144 on the MDF.

While Dancing with the Mouse on Sat, 13 Nov 1999 08:44:26 -0500, the Modem interrupted with an MNI from ""Dave or Debby" <truth@planetc.com>", and the MotherBoard buffered this to Video RAM:

  =
href=3D"news:382dad7f.9098439@news.iserv.net">news:382dad7f.9098439@news.=
iserv.net</A>...</DIV>Greetings!<BR><BR>[Hi=20
  Dave, good to know you're curious about this radio...]<BR><BR>... =
Ahhh, but=20
  wait, theres' more! ...<BR><BR>Delta Force, a big radio, with a lot of =

  buttons. Fun to play with, but<BR>can be dangerously distracting on =
the road=20
  when attempting to use the<BR>controls. You gotta' have it right in =
front of=20
```

```
  you at times to see the<BR>function buttons and set it up =
right.<BR><BR>It's=20
  not a simple radio, but can work like a Grant or Cobra 148 =
once<BR>set.=20
  Getting it set or re-set when accidentally bumped, makes this<BR>radio =

  dangerous to use in a moving vehicle!<BR><BR>Vertical mounting of the =
front=20
  face, and the sheer weight of parts on<BR>the main PCB does create a =
problem=20
  or two with vibration. Had one<BR>listener comment about SSB warble, =
due to=20
  the radios weight boucing on<BR>the bracket - there seems to be the =
need for=20
  some small revisions to<BR>some areas of the board to increase mass =
for=20
  connections. <BR><BR>The "warble" was due to voltage across some =
junction=20
  being affected by<BR>vibration, not by regulation. Tapping the main =
PCB, this=20
  shows up.<BR>Another fault of "First off the line model". =
<BR><BR>Speaking of=20
  which, I thought this was kinda neat, the board uses a<BR>larger =
regulator=20
  that can deliver power to the echo-talkback boards as<BR>well as =
supply the=20
  current demands rather well without tremendous<BR>amounts of heat. The =

  regulator circuit is simple, doesn't have short<BR>circuit protection, =
but=20
  does offer plenty of amperage to supply the<BR>board with power. =
<BR><BR>This=20
  would make an excellent base radio, but not an easy one to use in<BR>a =
moving=20
  vehicle.<BR><BR>Once you've set the display and tuning controls to =
what you=20
  want, the<BR>radio works just like any other CB radio, only a lot =
louder.=20
  Receiver<BR>performance is important. If you suffer from engine noise =
from=20
  a<BR>previous radio, this is not a miracle cure. But, once above the=20
  noise<BR>level, the received signals are wonderfully clear and crisp=20
  sounding.<BR><BR>The RF gain section needs more work, and AGC with ANL =
and NB=20
  - I found<BR>the radio noisier with these functions turned on in some =
cases=20
  than<BR>with them off and riding the RF gain control instead. =
<BR><BR>PCB=20
  board gets my vote on being better than Midland or other =
thinner<BR>boards and=20
  thickness of copper. Offers better and more solid<BR>connections. But =
this=20
  adds weight too. Some spacers on the bottom -<BR>foil side- of the =
board to=20
  help dampen vibration may help.<BR><BR>If they [new owners] drive, =
this radio=20
  is a bit complex. Once set, I<BR>found the front controls layout =
pretty good,=20
  although the dual gang<BR>controls at the clarifier and talkback/echo =
can be=20
  hard to work with<BR>when you have fat fingers.<BR><BR>As a benefit, =
there is=20
  a confirmation beep thru the speaker for some<BR>functions. To discern =
the=20
  different types, a long or short beep is<BR>heard. Not a bad idea, but =
once=20
  again, in a noisy environment you may<BR>never hear these tone beeps =
for keys=20
  pressed, and while you're<BR>standing still these beeps are annoying =
as h*ll=20
  in volume. Having to<BR>hold down a button till it beeps is another=20
  annoyance.<BR><BR>A simple radio, like the PC-122 is a lot less =
complicated=20
  for those<BR>that drive a lot and use the radio everytime in their =
vehicle.=20
  No<BR>confusing dual-gang controls and easy to "find home" versus on=20
  the<BR>MDF.<BR><BR>The dual gang controls are another one of my beef. =
The=20
  clarifier and<BR>talkback on on the same ganged control. Doesn't help =
with SSB=20
  users -<BR>touch one, the other control will also operate. Mine has a=20
  small<BR>"eccentric", read bent shaft, which affected the clarifier =
then=20
  you<BR>adjusted the talkback and vice-versa.<BR><BR>Changing bands =
were also=20
  another, as well as using modes and some of<BR>the "SHIFT" and =
"Function"=20
  buttons. Hard to remember programming and<BR>even harder to choose =
while=20
  driving. A rotary knob is far better to<BR>use in driving situations =
versus a=20
  small button, while you're bouncing<BR>along. You have to glance at =
the=20
  display all the time to verify where<BR>you're at and the mode your =
on.=20
  <BR><BR>Hey, Dave I appreciate you asking the question, I'm just being =

  honest<BR>with you. This just isn't a radio for those that can be too=20
  easily<BR>disracted while driving - too complex to use all it's =
functions,=20
  all<BR>while hurling youself down the road. I don't have the time to =
waste=20
  on<BR>trying to make a radio like this work when I've got other things =
to=20
  do<BR>while on the road. A simpler function radio does the same job=20
  and<BR>sounds about the same. Although if it's possible, the audio =
from=20
  the<BR>MDF would do wonders for any other CB radio.<BR><BR>But when =
you have=20
  time to play, this radio is good for that.<BR><BR>Another neat thing =
that=20
  could be expanded on, is the lighting control.<BR><BR>It has a brushed =

  aluminum faceplate decal on a clear plastic back. If<BR>they would =
only=20
  thicken the plastic a little more and offer less<BR>aluminum just =
under or=20
  around the knobs, to allow the clear plastic<BR>back to work like a =
fiber=20
  optic, the radio will have outstanding<BR>nightime illumination which =
would=20
  help a lot of drivers for nightime<BR>use. The LCD panel is quite =
bright at=20
  night, even with the dim feature<BR>on, and the model I have allows =
some of=20
  the light to pass thru into<BR>the front panel knobs so you could at =
least=20
  locate the Echo and<BR>Clarifier/Talkback pots if you look just=20
  right.<BR><BR>And er, no - not quite the same board. It's just =
components used=20
  in<BR>the areas like the final driver sections, and the audio amp=20
  sections<BR>as well as RX portions of the board, are similar - but =
layout=20
  is<BR>different. I'm saying that the operation of these areas, when=20
  trouble<BR>aises, are to be thought of as those along the 88-99 series =

  for<BR>troubleshooting. The component lables are good, but don't =
follow=20
  the<BR>Galaxy due to revisions in the numbering of parts. So, what my =
be=20
  D39<BR>on the Galaxy, might be D144 on the MDF.<BR><BR>While Dancing =

You also have to look at the power the batteries can instantaneously
supply..

Approximately 1100 amps per battery, for near 10 seconds.

And proportionally longer, when you don't ask them to supply as much.

Simple thinking skills should let you know that.

Because of the following reasons:

1. Some of them are attached via rubber grommets to keep squeaks down.
2. Some of them are painted before they are attached, because of primering
and such. The RF connection needs a low impedance to travel across, and
something that shows zero ohms DC resistance may not be good for RF....
Case in point, a piece of 24 guage wire.

But, you should know this already, right Pinhead?

I'd have to go with Exports R Us.....He's the one that "has it going on".
Coaxkid has done this in the past and export radios is an "unknown" .

Don't worry Cliffhanger, most hams started out as CBers but very few
hams sent their licenses back to the FCC and said let me go back to
CB. But I keep my CB in my truck and RV alnog with base station to
speak to my friends on CB. Never forget your roots and be willing to
help all, be radio-active.

Jeff, in the AMATEUR BANDS ONLY, the OO program only functions as an
Auxiliary to the FCC, the OO may accompany or work with the FCC. The
OO usually gathers evidence for the FCC. The OO is, however, respected
as an Expert Witness in a proceeding due to his "Ham" licensure and some
weight (Legal term-means judge usually believes him or her).

The same Federal Law that created the Amateur Auxiliary also also allows
for a CB FCC Auxiliary if an Organization could be found to sponsor
it.

The RF police can only call the FCC (the legal right of any free citizen
of the US), the FCC usually only watches, they are slow moving like a
snake but when they strike, they know how to hit. They love to gather
evidence as to keep everything airtight. And Secret, they don't revel
much due to the Federal Secrecy Law.

I don't trust ANYTHING the gov't says. These are the same people who make attempts to ban guns when all of the data shows that the stricter your gun control laws are the worse the violent crime rate is. These are the same people who refuse to ban products that have been the direct cause of many thousands of doccumented deaths but ban things like red M&M's because cancer showed up in some lab rat when it was force fed enough of that dye to cause it's fur to turn red. It was years before M&M Mars was able to find a different red dye that matched the orriginal color and passed the gov't approval. These are the same people who waste billions of dollars on a so-called war on drugs that has gone on for years with no noticable effect on the amount of drug use. In fact, drug use has increased instead of decreased.

And I'm supposed to believe what these folks say? Especially when it's supporting some law they've passed without my having a chance to vote on it? It'll be a frosty day in the under-regions before that happens.

O.K., let me make this simple for you...

I posted this once, but I guess that you can't read, or can't comprehend.

Please try this time.

You also have to look at the power the batteries can instantaneously
supply..

Approximately 1100 amps per battery, for near 10 seconds.

And proportionally longer, when you don't ask them to supply as much.

Simple thinking skills should let you know that.

Toll Free

This country owes it's very existence to people who broke the rules.  The
orriginal European settlers of this country saw fit to break the rules because
they were unreasonable, and unfair.

Anyone know what happened to him?

The box builder from the 80s.... Haven't heard anything about him, and have a couple people looking for him.

Anyone know?

Please reply via email.

From what I've seen so far they also advocate changes that just might eliminate
the need to run amplifiers. I saw a poll on thier web site that was designed to
help decide the order in which they want to make changes. One of the changes

was increasing the power limit. I don't know where in the poll results that
fell as far as order of importance, It obviously wasn't first as the first was
apparently removing the 250km limit. The fact that they were even willing to
consider it as an option means they're open to the idea.

wow, that really made sense... NOT!!!

The Constitution says that the FCC coming into my home without a warrant is illegal.

FCC rules are way different from state laws. In the majority of states, a new state law is put before the voting public. If the people of Alabama were given an opportunity to vote on the subject of CB rules and they voted to make amps illegal it'd be a totally different matter. I, as a citizen of Alabama, would be perfectly willing to abide by those rules. The federal gov't on the other hand has absolutely no business making any laws or rules or anything else that effects an individual American citizen. The federal gov't was created for the purpose of arbitrating disputes between the states, providing a military defense, and anything else that is beyond the ability of state gov't. There is no law the federal gov't can pass effecting an individual citizen that isn't easily within the ability of the state gov't where that individual lives. If California want's to legalize the medical use of marijuana it's absolutely none of the federal government's business. If Louisiana wants to keep the legal drinking age at 18, it's none of the fed's business. Yet in both of these cases the fed's overstepped thier Constitutional bounds by sticking thier nose into the internal affairs of those two states. Louisiana was forced by the federal gov't to raise the drinking age to 21. California legalized the medical use of marijuana, then the federal gov't said that they'd prosecute any doctor writing prescriptions for it.

You sir fit the profile of a PROZAC, the only thing I see in you in you that makes any sense in the amplifier world is that you must have 32 pill set of lips, problem is its producing only harmonics!

>
a natural resource??? what tree do you pick your ocillators off from?
trees, petrolium, metals etc are a natural resource.
radio transmissions, (RF spectrum), for reasons of this disscussion, are purely manufactured and synthetic and do not occur in nature.

sifting through all of the " why's and where for's", on the surface, the FCC and it's regulations are legal and have a noble mission.
looking under the carpet, there is one piece of dirt that ruins the whole carpet.
the constitution guarantees that no one can come into my home and search or sieze my property without just cause as determined buy a dualy appointed judge

and have a warrant issued by said judge.
then, if anything is taken, there is a right of due process that protects me from government abuse and this is called right of appeal. in the mean time i am innocent untill proven guilty.

ON THE OTHER HAND,

if the FCC thinks that i have broken a rule, by keying the microphone, they have written in the rules an assumed waiver of my rights to the above protections and think they can walk into my home without a warrant and rifle my radio shack.
if i refuse to let them in, they walk away and, in a few days, i get a letter from happy hollingsworth with a $4000.00 ticket to the FCC ball. NO probable cause and NO evidence to back up their suspicicions which i must pay unless i go to their office and convince them of my innocince.
if i get a speeding ticket, i can choose to pay it and plead guilty or i can go to court and not say a word and force the county to prove their case against me without helping their case at all unlike letting the FCC in and giving them the evidence against me which flies in the face of my rights against self incrimination.
the FCC "rules" were written in exact opposite of these constitutional protections.
here in florida, when you sign your drivers license application, you are also agreeing to take a blood alcohol test when asked by a law officer. this too has a noble cause as it can help deter drunk driving. i am 15 years sober and in no way condone drunk driving but if you look under the carpet, you'll find that if you refuse this intrusion into your body, (some localities require a blood test), you automatically loose your license for 6 months and your insurance company raises your rates as though you were convicted of dui.
there are some religions that ban alcohol use and also ban blood letting or transfusions.
what if some poor shmuck of one of these religious persuations works a double shift and is tired while driving home. he crosses into the next lane and is pulled over. granted, he shouldn't have been driving under these circumstances but he is NOT drunk, refuses a blood test and at most is guilty of careless driving, (a $54.00 ticket).
now he looses his license for 6 months and his insurance rates jump high enough to make an antenna enthusiast jealous.
all because he was exercizing his RIGHT to practice his religion by not letting the state violate his body.
same applys to my exercizing my RIGHT not to let the federal government violate my home un-waranted.
what worries me is that more and more branches of the government will bypass the constitution by instituting "rules" instead of "laws". big brother will become more and more intrusive as time goes on and, eventually, the constitution will become as effective as the ITU treaties, ie; nill.
don't call me paranoid as it happend with the FCC "rules and has happened here in florida. how many other federal, state and local laws follow this pattern and how many more are to follow?
think about it.

the thing i get a kick out of with the RF police is all of the FCC threats that
they make.
in one breath, they threaten to turn over to the FCC all the e-mail addresses
of people who post on the subject of mods or amps like they have some personal
control over enforcement and in the next, they say they have absolutly no pull
with the FCC so they don't look like a bunch of brown nosers.
the one that really made me LOL was the poor guy that asked a question about an
amp and some ham scorched him with threats of the wrath of the FCC.
the only hitch was that the guy's e-mail address clearly showed that he lived

in the U.K..i think the ham thought that the FCC was a division of interpol or his mind was so narrow and single-minded that he thought his RF badge had jurisdiction in England.
i actually enjoy assholes like these because it exposes the RF police for the bunch of shit heads that they really are.

who created it is not as important as what course it has taken in the last 65 years.
we have the best form of government in the world but, as with anything else, it's not perfect.
with the changing of the guard every 4 to 6 years, things can get pulled and distorted over that length of time into something that is unrecognizable as compared to what it looked like or what it's stated goals were at the time of it's inception.

Thanks for setting me straight, Jeff! I think I finally
unerstand:

You have $20 in your wallet.
You're not using it right now.
I will just take it.
The Constitution says nothing about this being illegal.
And the state laws are silly and unfair anyway.
The elected officials who wrote them are probably corrupt.
They discriminate against people who need $20.
After all, I need that $20 more than you do.
Lots of people take money every day and don't get caught.
And who's never broken a rule or two?
Police have more important crimes to deal with anyway.
You have $20 in your wallet.
You're not using it right now.
Therefore I will just take it.

>The DEA noticed how much she drove up and down that route and pulled her
>over,
>confiscated her motor home and she didn't get it back until nearly three
>years
>later after she had spent almost enough $$$ on lawyers to buy a new one

in pinellas county fla, a man was arrested on suspicion of drug possession.
his new vette was confiscated. the charges were dropped and it took him a year to get his car back.
when he got it back, the sheriffs dept had racked up 19,000 miles on the car with the excuse that they didn't want the drive train to lock up so they let the deputies take it home at night.
i drive 34 miles a day round trip to work every day and don't rack up 19,000 miles.
he sued for the dept for devaluation of the car.
this is the problem with the FCC. they don't write "LAWS", they write "RULES".
they don't have "FINES", they have "CIVIL FOREFEITURES" which DON"T require the same level of proof that a guilty verdict in a criminal court requires and doesn't always have the benefit of appeal.
it's a word game that they play that circumvents your civil rights.
regardless of wether O.J. was innocent or guilty, he was found innocent of murder in a criminal court but was found liable in a civil court for nicoles death.
show me the logic in this???
if the criminal court says he had nothing to to with the deaths, why does he owe $33,000,000.00 to the familys?
this is the same thing with the FCC.
they know that the triangulation coordanances, the key signature and voice print technology would be weak in a criminal court so the take it into the civil court arena where the preponderance of the evidence rules arn't so strict.
all they have to show is that they have a good idea that you're guilty and you've been had.
if it were taken into criminal court under it's rules, they'd all be wearing clown hats.

this is the scarry part.

>
> Breaking the law is breaking the law, Jeff. You're trying to claim
>that your law violation are less than another law violation, but it is
>still a violation of the law.

for one thing, i am NOT breaking any "LAWS".

the ONLY law that congress has made regarding the RF spectrum was 65 years ago in forming the FCC.
everything since has been "RULES" written by the FCC.
so what your saying is that if i deserve a public flogging for my activities, you do too for excedeing the speed limit on the highways or if you J-walk or flip a piece of trash on the ground? after all, your law violation is no less than my rule violation.

> One major aspect of Amateur Radio is the
> self-policing of our own frequencies.

key word here is policing "OUR" frequencies.
cb policing is out of the hams domain and in the domain of the FCC ONLY.
even then, in your frequencies, you have no "police" authorities in the ham bands.
you can use direction finding equipment and ASSIST the FCC but you, yourselves have NO right to tell anyone anything. contrary to popular belief, you did NOT receve a badge with your ticket.

> The FCC has repeatedly said that
> they expect that.

of the hams on the ham freqs. not cb.

> If you didn't go around bragging about your illegal activities in this
> newsgroup, we would not even know you were there, Jeff. We know you are
> there because you told us - right here in this newsgroup.

and, by the same token, the hams have no right to complain when they get their hair scorched when they come here with their DF antennas on their heads like halos and presume that they have the power of God to tell anyone what to do.
we don't go to rec.amateur and troll for arguements there, do we? the funny thing is, i've been there and helped hams with ILLEGAL mars / cap mods and admitted publically that i was an out-bander.
i have never met with so much as one post condemning me for what i do.
most comments are either neutral or live and let live. it's a whole different,(higher), class of ham there unlike here.

> And, once you make statements in this newsgroup, other CB'ers have a
> right to comment on those statements. That includes the CB'ers who also
> hold a ham license.
>

this is true. if you want to comment for or against my activities and debate the issues, i welcome this with open arms.
it's when you come here and act like we're some kind of trash, just because we don't wipe our collective asses with a ticket, this is when i start shooting the RF mounted police right out of their saddles at the first sound of a gallop.

with every point you have brought up here, you have lost so many feathers that none of them fly.
does this mean that you have plucked yourself?

jeff

>>I was simply stating that you, as a CB'er without a ham
>license, would have little reason to post anything in the ham radio
>newsgroups.

i was corrected on this on this 3 months ago and have modified my stance since.
i HAVE posted to rec.amateur and HAVE helped hams with different problems
including mars and cap mods and mobile electrical noise problems and have
receved thank you's for them.
just because i don't wipe my ass with a ticket doesn't mean i don't have
something to contribute.

i just don't go trolling for trouble like you and the other RF police do here.

>Please stop trying to twist
>my words.

this is a trait that i've learned well in self defense from the RF police.

>If you want to read more into that then there is, then you
>have a very vivid imagination.

no, just past experence.
> However, I seriously doubt they were "ordering people around." You
>claimed that I was telling you what to do with my simple statement above
>- perhaps that is what they were doing and you just twisted their words also.

if you wern't here a couple of months ago, then you have no idea what you're
talking about.
it is you that is not reading something into this arguement something that was
here.
i suggest that, until you know exactly what you're talking about, you shouldn't
draw any conclusions about what went on here.
i'm not hasseling you, it just seemed that you fell right in line with the rest
of the RF police in the "company line" about peoples RF practices so in turn,
you got caught in the crossfire.

God created the mule, and told him, "You will be mule, working constantly
from dusk to dawn, carrying heavy loads on your back. You will eat grass
and lack intelligence. You will live for 50 years."

The mule answered, "To live like this for 50 years is too much. Please, give me no more than 20." And it was so.

Then God created the dog, and told him, "You will hold vigilance over the dwellings of Man, to whom you will be his greatest companion. You will eat his table scraps and live for 25 years."

And the dog responded, "Lord, to live 25 years as a dog like that is too much. Please, no more than 10 years." And it was so.

God then created the monkey, and told him, "You are monkey. You shall swing from tree to tree, acting like an idiot. You will be funny, and you shall live for 20 years." And the monkey responded, "Lord, to live 20 years as the clown of the world is too much. Please, Lord, give me no more than 10 years." And it was so.

Finally, God created Man and told him, "You are Man, the only rational being that walks the earth. You will use your intelligence to have mastery over the creatures of the world. You will dominate the earth and live for 20 years."

And the man responded, "Lord, to be Man for only 20 years is too little. Please, Lord, give me the 20 years the mule refused, the 15 years the dog refused, and the 10 years the monkey rejected." And it was so.

And so God made Man to live 20 years as a man, then marry and live 20 years like a mule working and carrying heavy loads on his back. Then, he is to have children and live 15 years as a dog, guarding his house and eating the leftovers after they empty the pantry; then, in his old age, to live 10 years as a monkey, acting like an idiot to amuse his grandchildren. And it is so.

Shit is a powerful word. Just think of all the concepts and ideas you can communicate with it. Shit may just be the most powerful word in the English language.

CONSIDER THIS:

You can be shit faced, be shit out of luck, or have shit for brains.

With a little effort you can get your shit together, find a place for your shit or decide to shit or get off the pot.

You can smoke shit, buy shit, sell shit, lose shit, find shit, forget shit, and tell others to eat shit and die.

You can shit or go blind, have a shit fit or just shit your life away.

People can be shit headed, shit brained, shit blinded, and shit over.

Some people know their shit while others can't tell the difference between shit and shineola.

There are lucky shits, dumb shits, crazy shits, and sweet shits.

There is bull shit, and horse shit.

You can throw shit, sling shit, catch shit, or duck when the shit hits the fan.

You can take a shit, give a shit, or serve shit on a shingle.

You can find yourself in deep shit, or be happier than a pig in shit.

Some days are colder than shit, some days are hotter than shit, and some days are just plain shitty.

Some music sounds like shit, things can look like shit, and there are times when you feel like shit.

You can have too much shit, not enough shit, the right shit, the wrong shit or a lot of weird shit.

You can carry shit, have a mountain of shit, or find yourself up shit creek without a paddle.

Sometimes you really need this shit and sometimes you don't want any shit at all.

Sometimes everything you touch turns to shit and other times you swim in a lake of shit and come out smelling like a rose.

Shit! When you stop to consider all the facts, it's the basic building block of creation.

And remember, once you know your shit, you don't need to know anything else.

Many people are at a loss for a response when someone says "you don't know Jack Schitt". Now, you will be able to handle the situation...

Jack is the only son of Awe Schitt and O. Schitt. Awe Schitt, the fertilizer magnate, married O. Schitt, the lawyer with Knee, Deep, & Schitt law firm.

In turn, Jack Schitt married Noe Schitt and the couple produced 6 children: Holie Schitt, Fulla Schitt, Giva Schitt, Bowl Schitt, and the twins, Deep Schitt and Dip Schitt (a high school drop-out).

After being married for 15 years, Jack and Noe divorced. Noe later married Joe Sherlock. Because her kids were still living with her, she wanted to keep her previous name. She was known as Noe Schitt-Sherlock.

Dip Schitt married Loda Schitt and they produced a cowardly son, Chic Ken Schitt. Fulla Schitt and Giva Schitt were inseparable throughout childhood and consequntly, married the Happens brothers in a dual ceremony.

The Schitt-Happens children were Dawg, Byrd, and Hoss. Bowl Schitt, the prodigal son, left home to tour the world. He recently returned with his new Italian bride, Pisa Schitt.

Now, when someone says you don't know Jack Schitt, you can correct them.

The Compleat SHIT List

THE GHOST SHIT

The kind where you feel shit come out, see the shit on the toilet paper, but there's no shit in the bowl.

THE CLEAN SHIT

The kind where you feel shit come out, see the shit in the bowl, but there's no shit on the toilet paper.

THE WET SHIT

You wipe your ass fifty times and it still feels unwiped. So you end up putting toilet paper between your ass and your underwear so you don't ruin them with those dreadful skid marks.

THE SECOND WAVE SHIT

This shit happens when you've finished, your pants are up to your knees, and you suddenly realize you have to shit some more.

THE BRAIN HEMORRAHAGE THROUGH YOUR NOSE SHIT

Also known as "Pop a Vein in your Forehead Shit".
You have to strain so much to get it out that you turn purple and practically have a stroke.

THE CORN SHIT

No explanation necessary.

THE LINCOLN LOG SHIT
The kind of shit that's so enormous you're afraid to flush it down without first breaking it up into little pieces with the toilet brush.

THE NOTORIUS DRINKER SHIT
The kind of shit you have the morning after a long night of drinking. It's most noticeable trait is the skid mark left on the bottom of the toilet bowl after you flush.

THE "GEE, I REALLY WISH I COULD SHIT" SHIT-
The kind where you want to shit, but even after straining your guts out, all you can do is sit on the toilet, cramped and farting.

THE WET CHEEKS SHIT
Also known as the "Power Dump". That's the kind that comes out of your ass so fast that your butt cheeks get splashed with the toilet water.

THE LIQUID SHIT
That's the kind where yellowish-brown liquid shoots out of your butt, splashes all over the side of the toilet bowl and, at the same time, chronically burns your tender poop-chute.

THE CROWD PLEASER
This shit is so intriguing in size and/or appearance that you have to show it to someone before flushing.

THE CRACK FLAPPER SHIT
This shit seems to create its own weather system. Your butt cheeks feel like they're flapping in the wind when this shit comes out.

THE MOOD ENHANCER
This shit occurs after a lengthy period of constipation, thereby allowing you to be your old self again.

THE "ON THE CLOCK" SHIT
This is any shit that you take while you are punched in at work. Lunch hour and coffee break shits do not qualify.

THE "BEST NICKEL I EVER SPENT" SHIT
This is any shit that you take in a "pay" bathroom. Thankfully, there aren't too many of these left. If you're ever in a Mexican border town, be sure to try one!

THE RITUAL
This shit occurs at the same time each day and is accomplished with the aid of a newspaper.

THE GUINESS BOOK OF RECORDS SHIT
A shit so noteworthy it should be recorded for future generations.

THE AFTERSHOCK SHIT

This shit has an odor so powerful than anyone entering the vicinity within the next 7 hours is affected.

THE "HONEYMOON'S OVER" SHIT

This is any shit created in the presence of another person.

THE GROANER

A shit so huge it cannot exit without vocal assistance.

THE FLOATER

Characterized by its floatability, this shit has been known to resurface after many flushings.

THE RANGER

A shit which refuses to let go. It is usually necessary to engage in a rocking or bouncing motion, but quite often the only solution is to push it away with a small piece of toilet paper.

THE PHANTOM SHIT

This appears in the toilet mysteriously and no one will admit to putting it there.

THE PEEK-A-BOO SHIT

Now you see it, now you don't. This shit is playing games with you. Requires patience and muscle control.

THE BOMBSHELL

A shit that comes as a complete surprise at a time that is either inappropriate to shit (ie. during lovemaking or a root canal) or you are nowhere near shitting facilities.

THE SNAKE CHARMER

A long skinny shit which has managed to coil itself into a frightening position - usually harmless.

THE OLYMPIC SHIT

This shit occurs exactly one hour prior to the start of any competitive event in which you are entered and bears a close resemblance to the Drinker's Shit.

THE BACK-TO-NATURE SHIT

This shit may be of any variety but is always deposited either in the woods or while hiding behind the passenger side of your car.

THE PEBBLES-FROM-HEAVEN SHIT

An adorable collection of small turds in a cluster, often a gift from God when you actually CAN'T shit.

PREMEDITATED SHIT

Laxative induced. Doesn't count.

SHITZOPHERENIA

Fear of shitting - can be fatal!

ENERGIZER vs DURACELL SHIT

Also known as a "Still Going" shit.

THE ROCKET SHIT

The kind that comes out so fast, you barely get your pants down when you're done.

THE LIQUID PLUMBER SHIT

This kind of shit is so big it plugs up the toilet and it overflows all over the floor. (You should have followed the advice from the Lincoln Log Shit.)

THE SPINAL TAP SHIT

The kind of shit that hurts so much coming out, you'd swear it's got to be coming out sideways.

THE "I THINK I'M GIVING BIRTH THROUGH MY ASSHOLE" SHIT

Similar to the Lincoln Log and The Spinal Tap Shits. The shape and size of the turd resembles a tall boy beer can. Vacuous air space remains in the rectum for some time afterwards.

THE PORRIDGE SHIT

The type that comes out like toothpaste, and just keeps on coming. You have two choices: (a) flush and keep going, or (b) risk it piling up to your butt while you sit there helpless.

THE "I'M GOING TO CHEW MY FOOD BETTER" SHIT

When the bag of Doritos you ate last night lacerates the insides of your rectum on the way out in the morning.

THE "I THINK I'M TURNING INTO A BUNNY" SHIT

When you drop lots of cute, little round ones that look like marbles and make tiny splashing sounds when they hit the water.

THE "WHAT THE HELL DIED IN HERE?" SHIT

Also sometimes referred to as The Toxic Dump. Of course you don't warn anyone of the poisonous bathroom odour. Instead, you stand innocently near the door and enjoy the show as they run out gaggin and gasping for air.

THE "I JUST KNOW THERE'S A TURD STILL DANGLING THERE" SHIT

Where you just sit there patiently and wait for the last cling-on to drop off because if you wipe now, it's going to smear all over the place.

FARTS DEFINED

THE ANTICIPATED FART: This one warns that it is back there waiting for some time before it arrives. A person who is uneasy for a time in a crowd and who later farts at a time when they think no one will notice has farted an Anticipated Fart.

THE BACK SEAT FART: This is a fart that occurs only in automobiles. It is identified chiefly by odor. The Back Seat Fart can usually be concealed by traffic noise as it is an eased-out fart and not very loud. But its odor is foul, will give it away, due to the way air moves around in a car. And then someone will say, who farted in the back seat?

THE BARN OWL FART: A familiarity with owl calls is helpful in identifying this fart. Almost any morning if you get up just before daybreak you can hear one of these birds talking to himself. It's a sort of a crazy laugh, particularly the way it ends. If you hear a fart that has about eight notes in it, ending on a couple of down notes, and it sounds maniacal, you have heard the rare Barn Owl Fart.

THE BULLET FART: Its single and most pronounced diagnostic characteristic is its sound. It sounds like a rifle shot. The farter can be said to have snapped it off. It can startle spectators and farter alike. Fairly common following the eating of the more common fart foods, such as beans.

THE COMMAND FART: This fart differs from the Anticipated Fart in that it can be held for long periods of time waiting for the right moment. Unlike the Anticipated Fart, it is intended to be noticed. Harold Tabor recently held a Command Fart for the whole period in history class and let it go right at the end when the teacher asked if there were any questions.

>THE COMMON FART: This fart needs little description. It is to the world of farts what the house sparrow is to the world of birds. I can see no point in describing this far any further.

THE CUSHIONED FART: A concealed fart, sometimes successful. The farter is usually on the fat side, sometimes a girl. They will squirm and push their butt way down into the cushions of a sofa or over-stuffed chair and ease-out a fart very carefully without moving then or for some time after. Some odor may escape, but usually not much. Common with some people.

THE DUD FART: The Dud Fart is not really a fart at all. It's a fart that fails. For this reason it is strictly a group one identification fart, because there is no real way you can identify a fart that somebody else expected to fart but didn't. It is the most private of all farts. In most cases the farter usually feels a little disappointed.

THE ECHO FART: This is a fart that can be wrongly identified. It is not some great loud fart in an empty gym or on the rim of the Grand Canyon. The true Echo Fart is a fart that makes its own echo. It is a two-toned fart, the first tone loud, then a pause, and then the second tone. Like an echo.

THE G AND L FART: This is one of the most ordinary and pedestrian of farts, known to everyone. Certainly it is the least gross. If you have not already guessed, G and L stands for Gambled and Lost. One of the most embarrassing of all farts, even when you are alone.

THE GHOST FART: A doubtful fart in most cases, as it is supposed to be identified by odor alone and to occur, for instance, in an empty house. You enter and smell a fart, yet no one is there. People will insist that only a fart could have that odor, but some believe it is just something that happens to smell like a fart.

THE HIC-HACHOO-FART FART: This is strictly an old lady's fart. What happens is that the person manages to hic cough, sneeze, and fart all at the same time. After an old lady farts a Hic-Hachoo-Fart Fart she will usually pat her chest and say, "My, my", or "Well, well". There is no reason she should not be proud, as this is probably as neat an old person's fart as there is.

THE JERK FART: The Jerk Fart is a fart by a jerk who smirks, smiles, grins, and points to himself in case you missed it. It is usually a single-noted, off-key, fading away, sort of whistle fart, altogether pitiful, but the jerk will act as if he has just farted the Biggest Fart in the World Fart.

THE JOHN FART: The John Fart is simply any ordinary fart farted on the john. It is naturally a group one identification, with the wound, whatever it was, somewhat muffled. If it is all the person's trip to the john amounted to he will be disappointed for sure. Common as pigeons.

THE LEAD FART: The heaviest of all farts. It sounds like a dropped ripe watermelon. Or a falling body in some cases. It is the only fart that goes thud. Except for the odor, which is also very heavy, it could be missed altogether as a far. What was that, you might think? And never guess.

THE MALTED MILK BALL FART: Odor alone is diagnostic and positively identifies this fart. It smells exactly like malted milk balls. No other food works this way. It is rare.

THE OH MY GOD FART: This is the most awful and dreadful stinking of all farts -a fart that smells like a month-old rotten egg - as the Oh My God Fart. If you should ever encounter it, however, you may first want to say, oh shit, which would be understandable.

THE OMEN FART: This is the adult version of the Poo-Poo Fart. About the only difference is that the farter will not say anything. He will just look kind of funny and head for the john. This one is easy to spot if you pay attention.

THE ORGANIC FART: Sometimes called the Health Food Nut Fart. The person who farts an Organic Fart may be talking about the healthy food he eats even when he farts. If he is heavily into health foods he may even ask if you noticed how good and pure and health his fart smells. It may smell to you like any other fart, but there is no harm in agreeing with him. He is doing what he thinks is best.

THE QUIVER FART: A group one identification fart only. When you fart, it quivers. If it tickles, then it is the Tickle Fart. If you have to scratch it, then it is the Scratchass Fart.

THE RAMBLING PHADUKA FART: You must not be fooled by its pretty-sounding name, as this is one of the most frightening of all farts. It is frightening to farter and spectator alike. It has a sound of pain to it. What is most diagnostic about it, however, is its length. It is the longest-lasting fart there is. It will sometimes leave the farter unable to speak. As though he has had the wind knocked out of him. A strong, loud, wavering fart, it goes on for at least fifteen seconds.

THE RELIEF FART: Sound or odor don't matter on this one. What matters is the tremendous sense of relief that you have finally farted. Some people will even say, "Wow, what a relief". Very common.

THE RELUCTANT FART: This is probably one of the oldest farts known to man. The Reluctant Fart is a fart that seems to have a mind of its own. It gives the impression that it likes staying where it is. It will come when it is ready, not before. This can take half-a-day in some instances.

THE RUSTY GATE FART: The sound of this fart seems almost impossible for a fart. Is is the most dry and squeaky sound a fart can make. The Rusty Gate Fart sounds as if it would have worked a lot easier if it had been oiled. It sounds like a fart that hurts.

THE S.B.D. FART: S.B.D. stands for Silent But Deadly. This is no doubt one of the most common farts that exists. No problem of identification with this one.

THE SANDPAPER FART: This one scratches. Otherwise it may not amount to much. You should remember that if you reach back and scratch, it automatically becomes a Scratchass Fart. Common.

THE SKILLSAW FART: A truly awesome fart. It vibrates the farter. Really shakes him up. People back away. It sounds like an electric skillsaw ripping through a piece of half-inch plywood. Very impressive. Not too common.

THE SONIC BOOM FART: The people who believe in this fart claim it is even bigger than the Biggest Fart In The World Fart. The Sonic Boom Fart is supposed to shake the house and rattle the windows. This is ridiculous. No fart in the world shakes houses and rattles windows. A fart that could do that would put the farter into orbit or blow his crazy head off.

THE SPLATTER FART: Unfortunately the Splatter Fart exists. It is the wettest of all farts. It probably should not be called a fart at all.

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN........

> manufactured and synthetic and do not occur in nature.

Not totally true.

RF is a limited resourse, and mother nature has provided it to us.

Their was RF long before their was a receiver to hear it on.

Just listed to one of the radio telescopes.

We aren't making those signals.

> sifting through all of the " why's and where for's", on the surface, the FCC
> and it's regulations are legal and have a noble mission.
> looking under the carpet, there is one piece of dirt that ruins the whole
> carpet.
> the constitution guarantees that no one can come into my home and search or
> sieze my property without just cause as determined buy a dualy appointed

judge
> and have a warrant issued by said judge.

That is only to protect your rights.

Since the FCC has been created to "rule" (for lack of better terms) over the
RF specturm, your "right" to operate a radio transmitter becomes a
priveledge.

The constitution says nothing, nor does it serve to protect, priveledges.
Only rights. You don't have the right to operate a transmitter.

> then, if anything is taken, there is a right of due process that protects
me
> from government abuse and this is called right of appeal. in the mean time
i am
> innocent untill proven guilty.

And you are. That is why they don't throw you in prison when they find a
Palomar 225 on the bench when you are "invaded".

>
> ON THE OTHER HAND,
>
> if the FCC thinks that i have broken a rule, by keying the microphone,
they
> have written in the rules an assumed waiver of my rights to the above
> protections and think they can walk into my home without a warrant and
rifle my
> radio shack.

No, you have let their "assumed waiver" clause stick by putting an antenna
on your roof and broadcasting.

Or, even wording it closer, you have agreed to that rule by a binding
contract that took place when you put your station up.

Simple. Don't want to be invaded by the FCC, don't buy a transmitter.

> if i refuse to let them in, they walk away and, in a few days, i get a
letter
> from happy hollingsworth with a $4000.00 ticket to the FCC ball.

Right, but you also don't have to pay this until the FCC proves that you
where illegal, and they WILL get a warrant when you refuse entry, as that is
probably cause of illegal actions happening in the home or business! You
agreed to the rules when you put a transmitter in your home!

NO probable
> cause

Yes, the probable cause was you not granting entry!

>and NO evidence to back up their suspicicions

Sure their was... Your neighbors where complaining of bleedover.

You have a transmitter.

They must take measurements, up to and including monitoring of your shack before they can say it was you.

This is called "Probable Cause".

Don't like it, don't agree to the rules.

For that to happen, you have to cease and decist with your transmitter!

which i must pay unless i
> go to their office and convince them of my innocince.

Or take to court.

Newsflash... Your going to lose. Should have granted entry in the first place.

> if i get a speeding ticket, i can choose to pay it and plead guilty or i can go
> to court and not say a word and force the county to prove their case against me
> without helping their case at all

Right. And then all that has to happen is for the cop to state that he got you on RADAR, or that he clocked you.

He shows that the RADAR gun has been run in accordance with the guidelines of calibration, and you are dead in the water.

Silent the entire time.

unlike letting the FCC in and giving them the
> evidence against me which flies in the face of my rights against self
> incrimination.

You really think it is any different?

Dont speed. You won't get a ticket.

Don't run a linear... You won't get busted.

> the FCC "rules" were written in exact opposite of these constitutional
> protections.

No their not. They give you a choice. Don't want to follow them, or allow the intrusions into your home or private space... Don't! Just make sure that you are legal...

Or, don't run anything that will cause you to fall under their jurisdiction!

And, you can see below to see more evidence of this:

> here in florida, when you sign your drivers license application, you are
also
> agreeing to take a blood alcohol test when asked by a law officer. this
too has
> a noble cause as it can help deter drunk driving. i am 15 years sober and
in no
> way condone drunk driving but if you look under the carpet, you'll find
that if
> you refuse this intrusion into your body, (some localities require a blood
> test), you automatically loose your license for 6 months and your
insurance
> company raises your rates as though you were convicted of dui.

Because when you signed the papers getting your license, you agreed that if you refused a test, you where in essense pleading nolo contendre to the charge.

> there are some religions that ban alcohol use and also ban blood letting
or
> transfusions.
> what if some poor shmuck of one of these religious persuations works a
double

careless
> driving, (a $54.00 ticket).
> now he looses his license for 6 months and his insurance rates jump high
enough

> to make an antenna enthusiast jealous.
> all because he was exercizing his RIGHT to practice his religion by not letting
> the state violate his body.

Yes, but he agreed to let it happen when he decided that he wanted to exercise the PRIVILEDGE of driving!

Simple concept here. The government regulates both.

You agree to them when you

A. Get a drivers license
B. Operate a "licenseless" transmitter.

> same applys to my exercizing my RIGHT not to let the federal government violate
> my home un-waranted.

But, you waive the right when you purchase a CB radio transmitter.

Simple concept, Jeff. If you don't want to have to let them in your home, don't purchase and use a transmitter.

> what worries me is that more and more branches of the government will bypass
> the constitution by instituting "rules" instead of "laws". big brother will
> become more and more intrusive as time goes on and, eventually, the
> constitution will become as effective as the ITU treaties, ie; nill.

However, their is one thing that you seem to not want to face...

A law is something that deals with your freedoms or intangible items (rights).....

A RULE is something that deals with a priviledge. Both operating a CB radio station and driving a car are not your god given rights.

Oh yeah....I just found the e-mail you sent me a few months ago asking me to put you on our links page.
Then you go to say that you will add a link to my page from yours. There have been others that you have asked too. Should I post them too?

Don't make me proove that you are a liar.

You need to grow up and stop this nonsense. You are getting nowhere with all this garbage that you are posting. Except making enemies.

Oh come on, Jeff. That whole tirade above is pure misinformation.
The FCC does not just issue "Apparent Liability for Forfeiture" notices
to just anybody. They always have probable cause, and evidence, before
they go around handing out those notices.

This evidence may include RDF evidence, signal analysis, tapes of actual broadcasts, sworn statements of others, and more. In other words, they do not have to enter your home to establish that your radio equipment is being operated illegally.

As far as entering your home is concerned, the FCC does not just enter your home without a warrant. They knock on your door and ask permission to enter. You always retain the right to refuse entrance.

Yes, if you refuse, you stand a good chance of getting a "Notice of Apparent Liability for Forfeiture." But, since they already had enough evidence to warrant an attempted inspection of your station in the first place, you would probably get that notice no matter what you did.

If fact, the station inspection if more of an effort to establish the innocence of the operator, not the guilt (they already think you are guilty before attempting the station inspection). The inspection would prove that your equipment is legal (in spite of evidence otherwise), and therefore eliminate any further actions by the FCC. Refusing the station inspection only means that the FCC must rely on its existing evidence, with already shows that you are operating illegally.

You always have to right to appeal a "Notice of Apparent Liability for Forfeiture," Jeff. You can appeal within the FCC system or you can request that the case be heard in a civil court. Of course, when heard in a civil court, the amount of potential liability may increase and you may also have to pay court costs if found guilty.

And, if you had refused a station inspection, the burdon falls on you to prove that their existing evidence is wrong. That is absolutely no different than any other civil court case. The prosecutor gives evidence that attempts to prove your guilt in the civil matter. Your defense is to prove that the evidence is wrong.

Show me a single case where the FCC has entered a home without the permission of the owner and without a warrant. The FCC does not enter your home without permission from you (therefore, they never seek a warrant). If the FCC wants to inspect your station, they will simply knock on your door and ask permission to enter. You are always free to say no.

Your radio signal does not stop at the state line of Alabama. It has the potential to affect the residents of other states (in fact, many other states). And it also has the potential to affect the residents of other nations. Therefore, the regulation of radio operation does clearly fall under the authority of the federal government.

Never said I did. I said I have a right to complain to the FCC just like any other citizen.

> you can use direction finding equipment and ASSIST the FCC but you, yourselves
> have NO right to tell anyone anything. contrary to popular belief, you did NOT
> receve a badge with your ticket.

Okay.

> and, by the same token, the hams have no right to complain when they get their
> hair scorched when they come here with their DF antennas on their heads like
> halos and presume that they have the power of God to tell anyone what to do.

Try not using drugs during these conversations, Jeff. You're having paranoid delusions.

Sober up and try to listen to this one more time. We (the hams) are not trying to tell you what to do. The FCC sets the rules for radio use. We have a right to say that we agree with those rules. And we have a right to give our opinion when you claim to break those rules.

But, we are not telling you what to do. We do not have to power to do that, and we have never said that we do. And that fact that you are still operating illegally, in spite of the fact that you claim that we are telling you not to, clearly demonstrates that you know that. So why do you keep repeating this nonsense in these newsgroups?

> we don't go to rec.amateur and troll for arguements there

Nobody is trolling for arguments, Jeff. You have stated that you operate your radio illegally, and we have given our opinions about that. If you don't want an argument, keep your illegal activities to yourself.

> this is true. if you want to comment for or against my activities and debate

Drugs again, Jeff? You are the only one who has used the word "trash" in connection with yourself in this newsgroup. Is that how you see yourself? How sad.

And the people who thought they were above the rules operated the concentration camps. There can be both good rules and bad rules. You have an obligation as a human being to follow the good rules, and an obligation as a human being to fight the bad rules.

But, a rule does not become a bad rule just because you as an

```
individual does not like it, Jeff.  If that were the case, the men who
operated the concentration camps would have been justified in their actions.

But you have not established that the rules concerning CB radio use are unreasonable or unfair (we are talking about CB here). Just because one rule is unreasonable or unfair, it does not mean that ALL rules are unreasonable or unfair.

In my opinion, for the reasons I have stated many times in this newsgroup, the current rules concerning CB are reasonable and fair.

Again Jeff, you are attempting to mislead the readers of this newsgroup. Every single one on the ham operators posting to this newsgroup is also active on the CB band. Therefore, it is just as much their newsgroup as it is yours.

So, get off this our side of the pond versus their side of the pond crap. Since you know that we're also CB'ers (we've said it many times before), its intentionally misleading and therefore dishonest.

let's see. last night was saturday night.
a lot of people get drunk on sat. night.
that must be it as i can see no other reason for someone of your intelligence to babble like this.
the laws against theft of personal property make sense and do exist. besides, one could meet with great bodily harm in an attempt to take ones personal property.
none of what you said has anything to do with the issue at hand.
this is another attempt to compare apples to oranges and doesn't fly here and is just another attempt to side step the issue.
i recieved an e-mail from a ham this morning that answers many questions that i have presented here with no sucessful answers.
i am awaiting his permission to reproduce it here. if i do get it, i will reproduce it.
meanwhile, i'll send it to you privately along with some of my thoughts on the subject.
jeff

At the risk of getting flamed by TollFree I am listing some 10KV Oil filled
High Voltage Capacitors on Ebay. These are big and perfect for a PolePig power
supply (an electric company transformer). Check them out at-
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=200452819
Thanks for reading,
Jim

Want to buy 40-60 feet of Rohn tower (any size). Must be in good shape and
have top section that will hold a rotor and bearing. I will drive anywhere
in NC to pickup.   Please reply directly to blueglow@mindspring.com.

Thanks,

Dwight Stewart wrote in...
Perhaps that is true, but he claimed contact with 112 countries. There are
not 112 countries in Europe, nor are there 112 countries within the range of
any CB radio in this country, no matter how much power it was running or how
good the skip conditions are. So, like I said, impossible.

I'm sorry, but I do not buy this. As a matter of fact, I know for damn sure
this is a crock o crap. I'll admit I have never contacted 112 different
divisions/countries/terrotories/whatever-you-want-to-call-them.etc. yet with
my 2510 on 11 meters, but I do know from looking at other freebander's log
books and QSL collections that it IS possible to contact atleast 112
countries/divisions/territories/whatever-you-want-to-call-them/etc with a
reasonable amount of power.
I was able to contact almost every country is South America one day while
drivng down Interstate 94 between Detroit and Ann Arbor using 200w. This
was a few years before I got my ticket. No, it's not 112 differnet
countries, but not bad when your zipping down the highway on the way home
from work....

Don't waste your time, Tim. My demand for proof was rhetorical. First of all, you could send me all the QSL cards in the world, complete with certified letters swearing to their authenticity, and I still would not believe they were authentic. I do not believe that what you are claiming is possible, so any evidence to support that claim would obviously have to be fake.

What a pompus, self-righteous ass! Hey guys, not all of us ham..and in my case a professional AND ham radio person are not like this guy. Some of us are willing to open are minds to different ideas. I have seen proof that it CAN be done.. although I've yet to see proof of it BEING done.

I have three ten-foot pieces of Rohn25G plus bottom mounting plate that
I will part with in East Texas if anyone is interested. I'm about
equi-distant from Dallas/Austin/Houston.

in a civil court forum, this is right. this what i said before. they have written the rules to circumvent the rules of evidence.they have twisted the legal system to suit their agenda.

> This evidence may include RDF evidence, signal analysis, tapes of
>actual broadcasts, sworn statements of others, and more. In other
>words, they do not have to enter your home to establish that your radio
>equipment is being operated illegally.

again, this is what i said before, these things, in a criminal court proceding, would be weak at best.
if i were accused of murder, any analogy of these things could be used to establish probable cause. without the murder weapon with my finger prints on it, (my radio), it is all circumstantial evidence and would be difficult, at best, to prove. under the FCC rules, i am required to give them evidence against me by allowing them into my radio shack to confiscate my equipment. all without benefit of due process and a warrant. the constitution just took another step down.
if the FCC were heald to the constitutional rules of evidence, they would loose 99% of the cases that they would bring before a judge.

.> As far as entering your home is concerned, the FCC does not just enter
>your home without a warrant. They knock on your door and ask permission
>to enter. You always retain the right to refuse entrance.

then, under the premise of being guilty untill you prove your innocence, you get an nal. again, against the constitution.

>
> Yes, if you refuse, you stand a good chance of getting a "Notice of
>Apparent Liability for Forfeiture." But, since they already had enough
>evidence to warrant an attempted inspection of your station in the first
>place, you would probably get that notice no matter what you did.

answered above.

>they already think you are
>guilty before attempting the station inspection).

i rest my case. the constitution suffers another blow.

>Refusing the
>station inspection only means that the FCC must rely on its existing
>evidence, with already shows that you are operating illegally.
>

in a criminal court, the govt. would have to prove it's case without my help.
in a civil proceding, i would have to fight to prove my innocence. again,
against the constitution.

> You always have to right to appeal a "Notice of Apparent Liability for
>Forfeiture," Jeff. You can appeal within the FCC system or you can
>request that the case be heard in a civil court. Of course, when heard
>in a civil court, the amount of potential liability may increase and you
>may also have to pay court costs if found guilty.

exactly my point. i have to prove my innocence. if i were to appeal a murder
charge, basically, i would go to court and say i disagree with this or that
evidence and the govt. would have to prove to the judge the evidence is still
valid. in a civil court, no matter if i'm innocent or guilty, the advantage
lies with the FCC and the burden of proof lies with me. once again, against the
constitution.

> And, if you had refused a station inspection, the burdon falls on you
>to prove that their existing evidence is wrong. That is absolutely no
>different than any other civil court case. The prosecutor gives
>evidence that attempts to prove your guilt in the civil matter. Your
>defense is to prove that the evidence is wrong.

answered above with one side note here.
criminal courts were designed to settle offenses against laws made by the
government in accordance with the constitution.
civil courts were designed to settle disputes between private parties that do
not concern "legal issues".
if i were to put my fence over your side of the property line or damaged your
house and refused to rectify the situation.
we would wind up in civil court.
if we got into a fight over these issues and i attacked and injured you in the
fight, we would wind up in criminal court as i had broke a "law" involving
asault and battery.
the FCC "rules" are not laws, written and passed by congress as they should be
because the intent of these rules are to control the entire public should
everyone choose to own a transmitter.
just like the highway department controls the public should everyone choose to
drive.
the highway department goes through proper channels to make and pass laws
wether through local or national law making bodies.

the way the FCC "RULES" should be written as laws, if i disturb my neighbor with my RF activities and say, God forbid, i disrupt a 911 call and someone dies, he should be able to report me to the FCC with my "LAW" breaking complant. once cited, my neighbor could take me to civil court for redress of his loss.
this is what civil court was supposed to be about.
the way it is now with the FCC, by your own admission above, it has used the civil process to bypass constitutional rules of evidence and due process to expedite their agenda.
how many other govt agencys will catch on to this ruse and follow suit?
like i said before, O.J. was found innocent by a jury of his piers but he still owes $33,000,000.00 for something that a jury said he didn't do.
where's the logic in this?
i have nothing to hide but everything, (my constitutional rights), to protect.
jeff

I forgot to mention that you should please refrain from having channel
competitions with other people. This will only cause the owner to
shut the radio down.

He's already locked out the "Great Liberty Net" channel (3950) becuase
it apparently offended some people.

The Liberty Net has really gotten some people so stirred up that
apparently they will do just about anything to stop it.

I have heard conflicting modification procedures for the modulation for the Cobra 148 GTL ST.

They say to cut R131. (Yet I heard from someone that you should not cut the R131 if you have a radio with Sound Tracker).

Adjust VR10 for the AM power to max it out, (Counter clockwise)
Adjust VR11 for the SSB Power. (Clockwise)

Anybody know what to do with the R131 on a Sound Tracker (ST) Radio?

Thanks.

Jeff,
the interconnection between countries on ANY type of telcommunications
is overseen by the ITU, The ITU was founded in 1859 to standardize
telegraph connections between European countries as to allow for the
rapid passing of traffic or messages.  With invention of Telephone and
radio, the ITU assumed duties in regards with the Cairo Conferance of
```

1906 which set up an international standards committee which came up with the phonetic allocation scheme (K,N, and W along with AA to AK for the US, G and M for the UK, D for Germany, I for Italy and so on).
The ITU regulates the international usage of telephone, telegraph, data, radio etc. It became a dept of the UN when the UN was founded in 1945 and before that it was under the League of Nations in Geneva, Switzerland. The ITU is called a specialized dept of the UN and the Telephone money is a great source of revenue for some small countries. Radio is included since international conferences have delgated radio to the IYU since 1906. The IYU has set up the international allocations in regard to Marine, Business, military, amateur, radio telephone, medical devices and other radio services. The standard ITU agreement cover any type of electronic communication and is many pages long with technical BS from DC to Light. Every country on this planet has signed the ITU agreement since international interconnection depends on ITU standarization. Some countries are not close followers of ITU and some have no central functioning governments but those that do (about 99 percent of the world) want that telephone money.

The FCC administers the Civilian Portion of this program in the US and the NTIA (see www.ntia.gov) allocates usuage in the US for government and military usage on the Federal Level. (Some of freeband is NTIA stuff!). The FCC and FBI have concurrant jurisdiction with NTIA stuff. SCARY...

On the International level, ITU allocations differ from region to region, most of the Western Hemishpere is in Region 2 (Ham Test Question). CB radio in North America (Canada and the US) is 40 channel AM type emission (called A3 in ITU parlance) with a limitation imposed by only the countries themselves. In Cntral and South America, These so called export radios can be used on different channels since each country can set their own standards. (Hint: 26 to 28 Mhz around the world has been allocated to individual countries usuage, so each country may set up its own type of radio service as it wants). The high power stations from the south are mainly business types since VHF and UHF radio are so expensive. Costa Rica allows usuage of up to 100 watts ERP on Radio Personal which is their name for CB. Belize allows Business usage radio upto 35 watts on CB with extra channels available. This will shed some light on why CB is low priority with the FCC. The only beef I could see with this arrange and the ITU is that the ITU agreement states that the general usuage band we call CB can not be used for international contacts. Unless some country complains, the FCC will only pay minimal duty to the CB Band, however, some countries have been complaining about our CB and Ham Bands which I think has sparked the current round of enforcement. CUBA has complained about interference to its ham nets and repeater systems (We do pay some attention to Cuba since most Carribean telephone and microwave links pass by and through CUBA by international agreement from Florida).

I would recommend looking at the FCC website, searching the UN and ITU with search engines, The ARRL has a portion (chapter) of the rulebook outlining the ITU and relationships.

The main reason I got an Amateur Radio License was to communicate with home and almost every country honors an Amateur license without fail, however, there may be some bookwork involved but recip licenses can be obtained and it clears the path for you to carry radio gear in some countries which have a different view about 2 way radio.

In Columbia, CB radios are illegal without licensure and possession of unauthorized radios will put you on a collision course with the local gendarmes. Had a friend who was a radio hobbist who worked in Columbia on a Drilling Rig in the Jungle. He brought his scanner and 2950 10/11meter radio and got through customs (Oil drilling equipment) but on the rig, his radio skip chasing got quick notice form the Columbian Authorities (HOW? I really don't know, but I suspect drug/guerilla fighting). The legal hassle without a license cost him his job and expulsion from the country. He was asked, he told them he was a Ham and they asked for a licnese and found he wasn't licensed for Ham in the US, he was told he would have been eligible for a reciprical license but illegal operations were another thing. A $100,000 a year job lost.

Sure,
I welcome open discussion and the why becauses? Some Hams doen't know the becauses due to the fact they never studied Radio History and Radio Law and then the urban myths assciated with Ham and CB which both radio active types and civilians have no concept.
Example: 1. FCC Enforcement 2. Local or State Enforcement 3. ARRL and their volunteers 4. Emergency Operations 5. Powers and duties of an OO 6. Power, Harmonic and interference 7. Federal Privacy Law and other things.

Dispel the myths, get fact and ficton seperated and remember this:

Ignorance can be cured but hardheaded stupity can be terminal.
Listen and Learn and remember, research is the key to truth in Law.

Yes post me as you need to, use common sense and the truth is usually quite logical, there is a reason for every rule (not that I agree with the rules but they were created for a puropose.) :>

73 de Martin N5PZJ
if more hams would come here with accurate information as this gentleman has rather than the RF police, holier than thou, "because I said so" attitude, there would be a lot more dialog and education here than verbal bloodshed. take a lesson!!!
THANK YOU MARTIN!!!

jeff

Greetings!

When you say "CB" This limits the field to CB-only radios.

The two that come to mind are full-function with AM and SSB, but don't have WX.

Uniden Grant XL/LT.
Cobra 148 GTL.

The best of these two, are in favor with Uniden.

Simply, Uniden has maintained a better level of Quality while Cobras' once stellar high-cost-but-worth-it reputation has been marred by setbacks in both production and performance quality.

If you want WX, the bar lowers a bit and I would suggest...

Midland 79-290. Also includes AM/SSB but has WX and a removable Faceplate.

Some compromises here, small buttons, less than ideal Noise Reduction [ANL/NB] but does offer security and Weather. Small package a big plus for interiors with small limited space.

If you were to say, "best of any 11-meter radio both Import and Export", the field widens and I'm not even going to touch it...

While Dancing with the Mouse on Sun, 14 Nov 1999 14:20:07 -0500, the Modem interrupted with an MNI from "Pat Dolla <pdolla@videotron.ca>", and the MotherBoard buffered this to Video RAM:

:+> Where does the Uniden Grant LT and XL fit into this equation as far as cost vs
:+> quality? What in your opinion is the no holds barred best mobile CB on the
:+> market, price not withstanding? Pat.

<<let's see. last night was saturday night. a lot of people get drunk on sat. night. that must be it as i can see no other reason for someone of your intelligence to babble like this. the laws against theft of personal property make sense and do exist. besides, one could meet with great bodily harm in an attempt to take ones personal property. none of what you said has anything to do with the issue at hand. this is another attempt to compare apples to oranges and doesn't fly here and is just another attempt to side step the issue.>>

Not at all. I'm trying to point out that a great many of your present "justifications" for ignoring CB rules have a similarly delusional logic to them, that, as an otherwise reasonable person, you may not be aware of.

You continually compare 'apples and oranges' here, e.g.; the ARRL is like the Nazis...using illegal amplifiers is like Jaywalking....etc.

So stick to the issues, or call it quits.

I had 2 of these. I sold one and have this one left. It is a Leader LSG-227. It is almost like the B&K 2040 except it has digital readout. 2 meters and all that stuff are the same.This unit is an 8.5 on a 10 scale. The unit has NO RF output. I think it is the +5 volt power supply.

$100 plus about $12 to ship it to you.

Greetings!

Just don't buy an ST when it comes to figuring out what to do with R131.

Taking R131 out, and having ST, doesn't do anything for it. ST is the actual "Bottleneck". I'm looking to find sites that actually have removed the ST function, because I'll link to them due to the sheer number of questions I'm Emailed about this ST verus non-ST stuff.

While Dancing with the Mouse on Sun, 14 Nov 1999 16:36:32 -0500, the Modem interrupted with an MNI from ""Richard Camarata" <rtcamarata@mediaone.net>", and the MotherBoard buffered this to Video RAM:

:+> I have heard conflicting modification procedures for the modulation for the
:+> Cobra 148 GTL ST.
:+>
:+> They say to cut R131. (Yet I heard from someone that you should not cut the
:+> R131 if you have a radio with Sound Tracker).
:+>
:+> Adjust VR10 for the AM power to max it out, (Counter clockwise)
:+> Adjust VR11 for the SSB Power. (Clockwise)
:+>
:+> Anybody know what to do with the R131 on a Sound Tracker (ST) Radio?

:+>
:+> Thanks.
:+>
:+>

Regards!
:+> Andy <+:

I really do still keep a CB in my pick-up - seems a tad more macho than a cell phone, and frankly, is easier to use.

My name is Ed Williams. About two years ago I wrote down some old wild ass country boy stories about my upbringing in the big city of Juliette, Georgia - the tiny community where the movie "Fried Green Tomatoes" was filmed. It is the only thing other than term papers that I have ever written in my life.

Through a series of flukes, these stories were published the summer of 1998 under the title, "Sex, Dead Dogs, and Me - the Juliette Journals." When I first saw it in some bookstores I felt distinctly like the Forrest Gump of literature.

The book sold several thousand hardback copies, to the point that my publisher, a tiny one out of Dallas, Texas, began having problems filling the orders. Accordingly, he reverted the rights to the book back to me and I currently have a literary agent shopping the book around to some larger publishers.

My agent called me and told me that an editor from a large southern regional publisher had contacted her and told her that she was going to look over my book during the next few days. She then added that she was going to review my web site as well.

This is where I need some help - my agent is telling me that we need to get as many web site hits as we can as it will help our book appear more viable to the publisher. Would ya'll possibly consider going over to my site and perhaps registering 1-2 hits? I don't even mind if you don't read one word while you are there, I'll still be grateful for just the hits alone. The URL is:

http://www.ed-williams.com

Thank you so much for any consideration you can give me.

Ed Williams

I mentionded this already but I never asked it as a question. Maybe toll can answere it. why doesent big radios dot com have anything aobut you or your stuff or how you got into cb or who you talk to or anything.

You should call it other-peoples-big-radios.com

another question do people actually pay $10.00 a month to have a bigadios
web site? You can get your own domainname for less then that. shesh

Greetings!

Yep! And I hang out on Ch 28 mostly in the mornings - about 6:00 to 7:00 during the commute into work.

Have some friends on 2M that I chat with when skip is heavy around noon. All of them started and still use CB.

While Dancing with the Mouse on Sun, 14 Nov 1999 17:53:51 -0500, the Modem interrupted with an MNI from "cliffhanger <spmhtr52@hotmail.com>", and the MotherBoard buffered this to Video RAM:

:+> Hi andy,
:+> I noticed that your ISP is Iserv. Cool. Im from GR also. Is
:+> handy andy your CB handle? If so, I'll give you a shout sometime.
:+>
:+> 73's

The Man wants a BROWNING (Cobra) 135 base CLASSIC, so why do you want him to get a common 142 or 2000, which are less rare ?
Dave

Tos:
No, God did make the 11 meter CB band, & every other freq. too. The 6th plank of the Communist Manifesto is what is evil. What about the USSR owning low freq. transmitters doing alleged damage to US ? Who is more evil --a 50kw 6th planker radio station, or an individual running 100 watts ? What about the wicked broadcasters on 52-890 mhz ? What goes on there is

```
a lot more evil than some dummy splattering a few 10kc on 11 meters !  Dem
TV stations have BIG linears, & when that E skip rolls, you can get their
junk over 1k miles away!!!
Dave !!!!!

I was asked about this radio the other day.

(a) what is it the same as?

(b) If different, is it a good mobile or "truck driver" radio ?

Dave !

The only thing you would be flamed for is spreading disinformation.

However, those seem like decent caps..

A little low in capacity for a complete 15Kw broadcast transmitter, especially using a pole-pig, but decent nonetheless.

I totally agree.

However, I still prefer the 11 meter MB8719 (148 / Grant) chassis to the
"export" type radios.

Jeff,

Your getting out in left field with this.

Sorry bud, but I must interject into a thread that I really tried to stay
away from:

> >The FCC does not just issue "Apparent Liability for Forfeiture" notices
> >to just anybody. They always have probable cause, and evidence, before
> >they go around handing out those notices.
>
> in a civil court forum, this is right. this what i said before. they have
> written the rules to circumvent the rules of evidence.they have twisted
the
> legal system to suit their agenda.

No, they haven't. You agreed to the rules when you bought a CB and began to
operate it. It is plain and simple.

>
> > This evidence may include RDF evidence, signal analysis, tapes of
> >actual broadcasts, sworn statements of others, and more. In other
> >words, they do not have to enter your home to establish that your radio
> >equipment is being operated illegally.
>
> again, this is what i said before, these things, in a criminal court
proceding,
> would be weak at best.

Sorry, but they are not. You can prove with digital "fingerprinting" of a
transmitters key-clicks that it is the only one.

The key clicks of a transmitter are the electronic DNA of said piece of
equipment.

Then, they can fall back on field strength measurements.

These are all based upon scientific fact.

Their have even been court cases (I know of) out in California against
people (for stolen equipment) that they used the digital fingerprinting of
the keyclicks.

The people with the stolen equipment where busted.

It is legal, it is scientific, and it is fact.

> if i were accused of murder, any analogy of these things could be used to
> establish probable cause.

You contradict yourself.

If they establish probable cause, your GUILTY!

 without the murder weapon with my finger prints on
> it, (my radio), it is all circumstantial evidence and would be difficult,
at
> best, to prove.

No, but it isn't. Digital fingerprinting can, and is, used to convict
people of misusing radios, causing interferience and out of band
broadcasting.

 under the FCC rules, i am required to give them evidence
> against me by allowing them into my radio shack to confiscate my
equipment. all

> without benefit of due process and a warrant.

Yes.

Don't like it?

Don't use a radio.

Plain and simple.

If you don't like having to give blood or breath when a cop thinks your
drunk?

Don't drive.

 the constitution just took
> another step down.

No it didn't.

The constitution protects your rights.

Operating a radio is not a right.

Neither is driving a car.

> if the FCC were heald to the constitutional rules of evidence, they would
loose
> 99% of the cases that they would bring before a judge.

They do have to hold to those rules.

Take a look at part 95 and part 97.

When you purchase a radio that falls under the amateur radio clause, and get
your license, you have given the FCC carte blanche to enter your premises
when they believe your causing a problem.

When you purchase a CB and operate it, you do the same thing.... That is a
passive agreement, much like a verbal one, but holds water in court.

Don't think it would?

Go take a look at how many people have lost cases in the courts!

>
> .> As far as entering your home is concerned, the FCC does not just enter
> >your home without a warrant. They knock on your door and ask permission
> >to enter. You always retain the right to refuse entrance.
>
> then, under the premise of being guilty untill you prove your innocence,

you

> > Yes, if you refuse, you stand a good chance of getting a "Notice of
> >Apparent Liability for Forfeiture." But, since they already had enough
> >evidence to warrant an attempted inspection of your station in the first
> >place, you would probably get that notice no matter what you did.
>
> answered above.

But, you didn't answer it.

>
> >they already think you are
> >guilty before attempting the station inspection).
>
> i rest my case. the constitution suffers another blow.

Where? Are you stating that a simple field strength reading wouldn't be
able to tell if someone was running illegal power or not?

Hell, my twelve year old can operate a field strength meter!

>
> >Refusing the
> >station inspection only means that the FCC must rely on its existing
> >evidence, with already shows that you are operating illegally.
> >
>
> in a criminal court, the govt. would have to prove it's case without my
help.
> in a civil proceding, i would have to fight to prove my innocence. again,
> against the constitution.

No, in either case, the government would present it's facts, you would say
that you wouldn't let them in. This, in and of itself is against the
"rules" you agreed to when you began operation of the radio!

BAM!!!

GUILTY!

>
> > You always have to right to appeal a "Notice of Apparent Liability for
> >Forfeiture," Jeff. You can appeal within the FCC system or you can
> >request that the case be heard in a civil court. Of course, when heard

> >may also have to pay court costs if found guilty.
>
> exactly my point. i have to prove my innocence. if i were to appeal a
murder

> charge, basically, i would go to court and say i disagree with this or that
> evidence and the govt. would have to prove to the judge the evidence is still
> valid. in a civil court, no matter if i'm innocent or guilty, the advantage
> lies with the FCC and the burden of proof lies with me. once again, against the
> constitution.

No, you decided that you would rather face them in court when you said "no"
to them when they asked to inspect your station.

Once again..

Don't like it?

Don't use a radio.

Simple.

The FCC has stated that if you want to use a radio transmitter in the US or
it's possessions, you have to allow for inspection upon other evidence(s)
that alledge you are operating illegally.

If they asked to inspect, you said no, and then they went to court and had
no evidence that the inspection was warranted, and on good faith, then you
would win.

However, since you BROKE the agreement that you entered into with the United
States of America, and the Federal Communications Commission, you are in the
wrong.

>
> > And, if you had refused a station inspection, the burdon falls on you

> just like the highway department controls the public should everyone
choose to
> drive.
> the highway department goes through proper channels to make and pass laws
> wether through local or national law making bodies.

You must have really flipped your lid!

The highway department doesn't have to ask the voters what they want the
speed limit to be!

They set it at what they feel is right.

If they want to change it, they can ask, but they certainly don't have to!

> the way the FCC "RULES" should be written as laws, if i disturb my
neighbor
> with my RF activities and say, God forbid, i disrupt a 911 call and
someone

> where's the logic in this?
> i have nothing to hide but everything, (my constitutional rights), to
protect.
> jeff

Sorry, Jeff, but your argument just doesn't hold water.

Operating a radio is not a right.
If you don't like the way the rules are, then don't operate a radio, or move
out of the US.

Hi,

Well, this discussion is getting out of hand....I think everyone
is just going crazy and talking about different things.
Its come to the point where it seems everyone is just confused.
If you think trimming your coax makes great improvements,
and you spend time pruning it (instead of your antenna) - I say you are
wasting your time,
but hey, it's your time.

It's why there are so many articles in QST magazine that are repeated
over
and over ("My feedline tunes my antenna!", QST magazine) about SWR.
These misconceptions have been around as long as coax itself.

Handy Andy likes to point out that ***mobile*** antennas have a problem

with the coax becoming part of the antenna system. Mobile antennas rely on
the car body for the "ground plane" - its literally part of the antenna system.
Since the connection to the car body is usually bad and the length of
the car body isn't the same as the shaft length - a certain condition
occurs.

Instead of the antenna currents being canceled out, current flows
back down the *outside* of the shield (braid) of the coax.

(The technical term for this is "common mode currents")

The coax actually becomes part of the antenna system. Therefore, changing
the length of the coax actually *will change* the SWR.

HOWEVER - this is NOT a desirable OR normal condition, and you should strive
to eliminate it. In fact, it's really a malfunctioning antenna system.
Coax is merely suppose to transfer energy from the radio to the antenna
(RG stands for Radio Guide).

On base antennas - this usually isn't a problem. Beams have gamma-matches or
baluns that de-couple the antenna FROM the feedline - eliminating
common mode currents. Therefore, when this condition IS NOT happening, changing
the length has no effect on the SWR.

Furthermore, feedline radiation (caused from common mode currents) skews
radiation patterns of beams and destroys gain and antenna efficiency.

Handy Andy also points out correctly, SWR meters suffer design problems
really making them a very inaccurate tool. If you change the length
of your coax and your SWR does change - this doesn't only mean you
have a common mode currents problem. The SWR meter could be in error.
(usually the lower your SWR - the more accurate the reading is).
This stems from several internal design flaws - cheaper SWR
meters are worse. I classify most internal SWR as useless.

So what does this all mean? When you have a properly functioning
CB antenna system - changing the length of your 50 Ohm coax will not
actually change the SWR - at any point on the coax line.
Of course, there are a few more unusual conditions that can cause SWR
to change - but if your system is working correctly - this won't
happen!

```
 |
 |
 |
\ /
 |
```

Now, some guys here know that changing the coax length changes how well their radio "loads" (or couples) to the coax. They found changing the coax length effects how much power the get into their coax. Simply said, changing coax length does effect what impedance your radio "sees" where the coax hooks to the radio. This impedance is a complex function of the antenna feedpoint impedance and coax length.

The closer this impedance (the combination of the antenna's feedpoint impedance and the effect of the coax length on the impedance) is to the impedance of the final Power Amp's impedance, the more power that actually goes into the coax (guys with tube finals don't have this problem, they have a built in matching network).

Instead of changing the coax length to get better coupling - you could use an "antenna tuner", which has the same effect as changing the coax length. (Antenna tuner is in quotes because it doesn't actually tune the antenna, it tunes the feedline!). The mismatch ******STILL******** exists at the antenna feedpoint!

")====}lllllllllllllllll}>------" wrote:
>
> OK MR. Coax, answer me this, does trimming the feedline affect the SWR of a
> endfire array?

I don't know what you mean, endfire arrays usally have an impedance of over 1000 Ohms - you don't use coax to feed them. I am strictly speaking of typical CB antenna fed with 50 Ohm coax...not ladder-line.

>and what about the phasing? will trimming the coax change the
> phasing? IM interested in seeing your answer this. Now we would be taking
> readings at the xmtr and this is 50 ohm coax.

Phasing? To the single antenna - what difference does the phase that the current is in when feeding the antenna? This doesn't have an effect on SWR.

What I am saying is - tune your antenna - its what counts. 50 Ohm Coax
length
is meaningless and unimportant to the properly functioning CB antenna.
It should be kept as short as possible to minimize loss.

BoB.

It think that both of you might have missed the point. Linears themselves are not evil nor are they the work of Satan. It is their use that is the work of Satan. It is written that we are to obey every ordinance of man (1 Pet 2:13). It doesn't matter if you agree with that ordinance. It is against the ordinances of man to use ANY amplifier no matter how small or large on 11-meters. You must agree that those who are in rule over you are there because GOD put them there. Evil people get evil rulers, I believe that is why God allows evil governments like Communists and other evil dictators. We are on the verge of another evil ruler here in America if we are not careful! If there is another democrat in the White House, Al Gore, I believe it will be then end of America as you and I have known it. Pray that we get a Republican or at least a real God fearing American in the leader's chair. BTW Dave, a 50kw station is a small station. Most FM radio stations in the US are 100kw. Most TV stations are 2 mega-watts or greater. Most VOA (Voice of America) stations are at least 25kw, some 100kw and larger.

Kevin

Greetings!

While I have faced a series of set-backs with setups I've done, most of the problems arise from Frame to Finish metal.

Well, it would be a long story, but one of the quick tricks is to not worry too much about "bonding" everything, it's not truly practical. If you have the time to do it, some of the rewards are nice, but you really should focus on the other aspect of getting most out of the metal you have.

The easiest way to demonstrate this, is to remember the old days and those older vehicles that tended to rust away at either a door hinge, or handle - where a simple bolt held it on the vehicle.

Those days are gone now, and if you look into how they fixed a lot of these problems, are thru the use of plastic spacers, nylon washers and PVC enclosures.

A few newer vehicles I've come across, and I don't know if this applies to all of them either, have some form of road-noise isolation for quieter rides. Although fine for most, a bane for a CB'er.

If you remember, one trick to help reduce noise is to bond the muffler to the frame of the vehicle.

Doing this on some vehicles, may actually increase noise.

The fix is simple. You don't simply "bond" the muffler to the frame with a simple drilled hole and a bolt. You tie the muffler to the frame and shell of the vehicle - you bolt it to ground at two locations close to the muffler - the hanger bolt attaching it to the vehicle and a short distance away, the Unibody structure. The nuts used to accept the muffler bolts may be only epoxied onto the shell, the additional bolt provides the direct connection.

These vehicles are Unibody - or seam welded and placed on a small and short frame that can withstand the torque produced by the motor, and able drag everything attached to it.

These connection points to the frame are isolated with rubber washer and spacers to provide movement for flex during high tourqe and lower road noise passed into the passengers, but can electrically insulate themselves from the two halves. The frame and shell are tied together at some point with some simple wire jumpers. Albeit simple, they appear to RF as useless.

My emphasis on this, is to make sure the frame and shell are bonded together more than a door panel. Many vehicles are painted first then assembled. Just loosen a bolt or two on the fender panels and tighten them back down helps loosen the painted threads and make a better connection needed to "bond" that part to the whole of the vehicle.

This method helps a lot in cases where the Fenders and even the hood latch, can increase the vehicles ability to conduct RF.

I don't recommend loosening and attempting to re-tighten the door hinges, you'd be better off using a braided ground strap on these parts. It's very difficult to get a door realigned to shut properly unless you have two or three people to help hold the door in alignment as you re-tighten. Unless you like to remove interior trim to hold it yourself...not fun.

Here's another trick, and a local store sells them. Its' a conductive grease with copper fillings suspensed in the fluid. You can remove a bolt, spread some of this conductive grease onto the threads, and then retighten the bolt. Bingo, good ground with corrosion resistance!

Works good for getting longer life out of battery cable connections too, but wonderful for taming noise and better conduction of key electrical connections needed to get the most out of your vehicle.

While Dancing with the Mouse on Sat, 13 Nov 1999 10:02:38 -0600, the Modem interrupted with an MNI from ""ice cream man" <pinhead_16@hotmail.com>", and the MotherBoard buffered this to Video RAM:

What we are promoting is courteous, respectful operations and further development of the CB Radio Service.

There are many on the "freebands" who while breaking the law (or rules for the sake of rec.radio.cb) operate in a fashion that would be approved by many, excepting their out of band transmissions.   There are those who use amplifiers or modified radios to increase output levels. As long as they are not using them in a mischievous or haphazard manner and want to see a change, they are welcome to be a part of the process. It's our hope that one day there won't be a need for amps or operating out of band by virtue of rule changes and better operating practices.

The fact of the matter is, I or anyone else has never denied membership to anyone so long as they filled out the membership form correctly. The whole concept of USCBOA is that if you join, you have a voice. Your voice, your chance to influence what we do to try and effect a change in CB radio. There are those in our ranks who operate illegally, those that do not. The common thread is that they practice good operating procedures, or are trying to anyway, and they want to see a change.

It seems that our ambiguity on the legal/illegal topic has caused some speculation. We that started the organization, happen to believe that there are problems with the Part 95 rules as well as with the lack of courtesy that permeates the band. This was evidenced in the poll that you referenced. I once thought that you could sum up the problems of the band simply as legal/illegal. When I gave the issue some thought, I had to question whether the rules have a roll in that. Obviously, laws that are grossly un-abided by many, aren't that practical. That's when I came to the conclusion that the problem lies on both sides of that particular fence. If we are to represent CB operators, then we must welcome all who want to see better communications on the band.

As I mentioned above, the whole idea of the organization is that everyone has a voice. I don't run it, although I do much of the work right now. Slowly others are taking on those responsibilities. When the ground work is laid, it will run on democratic principals. Members will voice their opinions to representatives who will then vote on the outcome. A person will preside over them, but only to conduct the process, not to influence the outcome. And hopefully, with a bare minimum of politics. If I have anything to do with it, the first person to bring up Roberts Rules Of Order will be tar and feathered <grin> We don't need political infighting and people on power trips. It gets everybody nowhere. That has been the downfall of many groups who had the chance to do something constructive. That and what color the hats, shoulder patches and tee-shirts will be. All of that is nonsense. We don't need any of that. There are enough hats and tee-shirts in the world already.

As for the recent petition, that more or less fell in our laps. Alan Dixon wrote it and handed it to us on a silver platter. He's had experience with petitioning the FCC for rule changes in the past. His advice was to start with the one most likely to succeed, and go from there. The DX limit actually came second in the poll with the freeband issue coming in at first. We were working on bringing people into the organization who could help us in such matters when Alan handed us the petition and asked how to join. We are very grateful to have him.

We have had the good fortune of having people in the organization from it's start that had connections to some very resourceful and influential people.

We do not charge anything for membership. There is a link on the site for those who wish to make a monetary donation, but that's it. We are doing everything on volunteer power right now. There are many who want to see CB stick around for the long run, and make it a better place. We recently had the good fortune of acquiring a sponsor who's generosity will pay for many of our administrative costs and get our web site on it's own domain name and a server.

I'm through arguing over what's bad about CB and how to change it. The people who joined me in the effort feel the same. It's time to actually do something about it.

We are having our second "net" by voice over the internet today (Sunday, November 14) at 1100 EST. We use a free program called Firetalk for this purpose. Anyone is welcome to join in. If you go to our web site at http://home.att.net/~uscb_association you will find all the information and links you need to download and setup the software.

And so there will be no speculation on the results of the poll, they are listed under my sig.

73
Jim USCB-9

Poll Results of USCBOA Poll #01
July 1999 to November 1999

Total Number Of Surveys Taken: 105

1. Many people who have been involved with CB since the 70's feel that when the FCC stopped issuing call signs, it allowed too much anonymity on the air, leading to the lack of courtesy and respect we hear on the radio today. Do you agree with this statement?

Base: Total Votes 102

51	(50%)	Yes
40	(39%)	I agree with it some.
11	(11%)	No

2. It has been proposed that this organization maintain a database of call signs and handles that can be referenced to the operator's name and address. This information would be made available to the organization's members via the internet. Do you think this is a good idea?

Base: Total Votes 102

68	(67%)	Yes
34	(33%)	No

3. Do you feel that changes are needed to the current Part 95 CB regulations?

Base: Total Votes 104

102	(98%)	Yes
2	(2%)	No...Skip to question 11.

4. If you answered yes to question 3, are you in favor of opening the "Freebands" to CB?

Base: Total Votes 104

88	(85%)	Yes
16	(15%)	No

5. If you answered yes to question 3, are you in favor of increasing the distance we are allowed to communicate under Part 95?

Base: Total Votes 102

95	(93%)	Yes
7	(7%)	No

6. If you answered yes to question 3, are you in favor of allowing FM communications on CB?

Base: Total Votes 103

83	(81%)	Yes
20	(19%)	No

7. If you answered yes to question 3, do you feel that the current power output limit of 4/12 watts should be increased?

Base: Total Votes 103

76	(74%)	Yes
27	(26%)	No

8 If you answered yes to question 3, which of these changes do you feel is most important?

Base: Total Votes 99

52	(53%)	Opening the freebands.
24	(24%)	Increasing the DX limit.
8	(8%)	Allowing FM communications.
15	(15%)	Increasing power output.

9. If you answered yes to question 3, which of these changes do you feel is second most important?

Base: Total Votes 97

25	(26%)	Opening the freebands.
48	(49%)	Increasing the DX limit.
12	(12%)	Allowing FM communications.
12	(12%)	Increasing power output.

10. If you answered yes to question 3, which of these changes do you feel is least important?

Base: Total Votes 98

8	(8%)	Opening the freebands.
12	(12%)	Increasing the DX limit.
52	(53%)	Allowing FM communications.
26	(27%)	Increasing power output.

11. What role, if any, do you feel that this organization should have in policing the ranks of CB operators?

Base: Total Votes 104

12	(12%)	None. That is the FCC's job.
67	(64%)	A passive roll. We should set an example of courteous and respectful operations on the air for others to follow.
25	(24%)	An aggressive roll. We should actively seek out offenders and turn their names over to the FCC.

12. Some people believe that one of the functions of such an organization should be to make available to it's members certain products and publications pertinent to the CB hobby. The profits of such enterprises should then be used to fund the organization's activities. Do you agree with this statement?

Base: Total Votes 102

59	(58%)	Yes
38	(37%)	I agree with it some.
5	(5%)	No

13. The only focus of this organization should be to represent the members to the FCC and other governmental agencies. Do you agree with this statement?

Base: Total Votes 104

38	(37%)	Yes

42	(40%)	I agree with it some.
24	(23%)	No

14. How should this organization be financially structured?

Base: Total Votes 102

62	(61%)	Non-profit
37	(36%)	Not-for-profit
3	(3%)	For-profit

15. Should this organization publish a newsletter?

Base: Total Votes 104

102	(98%)	Yes
2	(2%)	No

16. If you answered yes to question 15, how should this news letter be sent to its members?

Base: Total Votes 103

33	(32%)	Via email only.
62	(60%)	Via email and snail mail.
8	(8%)	Via snail mail.

17. Are you willing to donate time and effort to help with the administrative functions of this organization?

Base: Total Votes 100

18	(18%)	Yes
37	(37%)	Yes, but on a limited basis.
45	(45%)	No, I don't have the time.

18. Even if members donated time and equipment to this organization to conduct it's administrative functions, funds may still be needed for things such as web hosting, advertising and telephone service. How do you think such funds should be obtained?

Base: Total Votes 102

20	(20%)	Through charitable contributions.
27	(26%)	By charging dues to the members.
47	(46%)	All of the above.
8	(8%)	None of the above.

19. If you answered "By charging dues to the members" to the above question, what do you think is a fair amount to charge?

Base: Total Votes 78

45	(58%)	Less than $15 a year.
27	(35%)	$15 to $25 a year.
6	(8%)	$25 to $35 a year.

20. If this organization had an official web site, should it offer advertising on it's site to CB related enterprises to help offset administrative costs?

Base: Total Votes 103

97	(94%)	Yes
6	(6%)	No

hi again
i am stupid, i got my new cb, but i am having a terrible time trying to
figure out where to mount it in my 96 chevrolet cavalier.  i was going
to try mounting under the ashtray, but i can't get it out to get to it
to drill holes for the bracket.  so if anyone has any ideas, would you
please help me

thanks again
aaron

Hi folks
```

I am living in the UK, but next year I will be moving to Australia. To be
more precise, Coffs Harbour in north east NSW.
I would like to hear from any CB enthusiasts in Australia, and particularly
in the Coffs area. I am very interested in your UHF system and I'm also a
licensed ham, so I'm looking forward to getting "radio active" when I
arrive.
If you can offer any advise about aus CB, or send me relevant website
addresses, or just fancy a chat about CB or radio in general. Please drop me
an email.

cheers all
Jack

Do you have the center console? If so the back side of that is a good place tp
mount it. Use double sided tape if you dont want to drill holes in it.
Another good spot is between the visors. Coax can be hidden underneath the
head liner and in the the panels along the doors(pwr cord too). just a couple
of chioces to go on.

OK- Let me make it simpler for you Mr. Toll Free. I dont want to run 6KW for 10 seconds per battery. Most people that run that kind of power are not doing it with 12 volts (thats a whole other topic) which goes back to the even simpler formula of Ohms Power law (Power = Voltage X Current). My point is still that if you are running a box that is supposedly doing 6KW out, a 250 amp alternator is not going to keep up with it, at least not for very long. A good class AB2 amp(most of you are running class C by the distorted sound that I hear across the band) is only 55% efficent and would have to draw close to 12000watts of power from your alternator and battery(s). That equates to 1000amps. You are very correct that if I parallel a bunch of batteries this can be acheived but keep in mind that batteries are supposed to have 10 to 15% more alternator voltage to keep them charged and the specs for most alternators state that the total current drawn from an automotive system should never exceed the output of the maximum alternator current by more 10-15% for short periods of time. Now keying up for 10 seconds is a short period of time but the huge load placed on the alternator after you pull 1000amps from you batteries will still exceed the alternator ratings by many times its output current for a much longer time until they are charged up again. But then why am I explaining this to you? The simple way is to pull out your check book, buy a bunch of batteries, keep burning up alternators, wasting batteries, money and equipment rather than doing it the right way.

Jim

It works wonders in my radio. I don't have a means to test distortion,
but the area folks say it sounds clear, even though it is loud. And
believe me, it gets LOUD.

When I first installed mine, I was unsure of the settings, as I was

using it in combination with a D104. I flipped the switch on, and
people told me it was too loud. They had to turn their volumes down,
but then they were barely able to hear anyone else besides myself...

buy a small amp instead of stressing your radio trying to squeeze too much
power out.

Good luck and best regards from Tim 082.

Well, I'll be damned..

Jim here only wants to argue, and not realize that he is agreeing with me!

Jim, why don't you go back and look at the exchange I was having with the dummy and find out that I was not advocating this style of operation, just stating that it could, and has been, done.

Then, I guess I will have to show you a thing or two....
> OK- Let me make it simpler for you Mr. Toll Free. I dont want to run 6KW
for 10
> seconds per battery.

>>>1. Who said per battery? Usually their is a bank of three batteries, and when running this type of power, you are running at 16 or 18 volts, by series / parralleling either two 8 volts or a mix of 6 and 12 volts.

>>>2. So you don't want to see that kind of power for 10 seconds. This means shit to me. I am, and was then, talking of a shootout mobile setup. You can get by with less alternator in a shootout mobile, and this just reaffirms what I told the dummy when I said that it wouldn't hold it for 10 seconds.

>>>I really wish they had a school on-line to help people with reading comprehension skills. This newsgroup is really lacking!

 Most people that run that kind of power are not doing it
> with 12 volts (thats a whole other topic)

>>>>Your right.

>>>>See above. We do it with 16 or 18 volt systems.

>>>>That was already stated. Your slow to catch on.

 which goes back to the even simpler

> formula of Ohms Power law (Power = Voltage X Current). My point is still
that
> if you are running a box that is supposedly doing 6KW out, a 250 amp
alternator
> is not going to keep up with it, at least not for very long.

>>>>And that is exactly what I stated. Do we need to go back to the
original thread and see what was said, or are you just in the business of
arguing and making an ass out of yourself by quoting selectively?

A good class AB2
> amp(most of you are running class C by the distorted sound that I hear
across
> the band) is only 55% efficent and would have to draw close to 12000watts
of
> power from your alternator and battery(s).

>>>Class AB doesn't enter into the equation. We use Class C,. non-biased
boxes with what we use for competition. Enter 75 (or so) percent
efficiency.

That equates to 1000amps. You are
> very correct that if I parallel a bunch of batteries

>>>>Not a bunch. The gell cell batteries that I run hold 1100 amps at 12
volts for a good 8 seconds, and that is after not being charged for a while.

this can be acheived but
> keep in mind that batteries are supposed to have 10 to 15% more alternator
> voltage to keep them charged

>>>Duh... And on a 16 volt system (2 8s in series), we charge them about
18.5 volts.

>>>On a 18 volt system, I charge at 20 to 21 volts.

and the specs for most alternators state that the
> total current drawn from an automotive system should never exceed the
output of
> the maximum alternator current by more 10-15% for short periods of time.
Now
> keying up for 10 seconds is a short period of time but the huge load
placed on
> the alternator after you pull 1000amps from you batteries will still
exceed the
> alternator ratings by many times its output current for a much longer time
> until they are charged up again. But then why am I explaining this to you?
The
> simple way is to pull out your check book, buy a bunch of batteries, keep
> burning up alternators, wasting batteries, money and equipment rather than
> doing it the right way.

Gee, Jim, you just paraphrased what I had told the dummy.

Congratulations. You just became a parrot.

All that, just so you could argue. Where proud.

No, I layed their and laughed...

It seems that you fell in love, though, judging by the fact that you have become infatuated with me.

I was talking about you being a fuck, not fucking me, and not getting fucked.

I thought that was plainly simple.... But then again, I guess with your 60K dollar education, we better spell things out to the "T" with you.

You don't seem to understand english well.

Greetings!

Smoked R 183? Well, thats a 10 ohm resistor. Brown Black Black.

It belongs to the emitter of TR39. A 2SC1973. The wrong place to work on getting more power.

Try replacing it, and getting the Radio to TX again.

Once thats done, a search for mods on the radio can reveal a lot of different ways to accomplish the job.

While Dancing with the Mouse on Sun, 14 Nov 1999 15:36:31 GMT, the Modem interrupted with an MNI from ""Dogadeer" <dddancy@mediaone.net>", and the MotherBoard buffered this to Video RAM:

:+> Does any one know where i can find the schematic diagram for the cobra =
:+> 148 mobile? or better yet the resistor for R 183? I fried it and i =
:+> can't read the color codes. Thanks=20

Regards!

SPAMBOY.....This is not usually a good way to make friends. Show us you know more about radios than spamming the NG to move your radio crap and you'll get the customers.....not by thinking this is just a free place for you to dump on with ads for junk we can get anywhere. I think it would be safe to say that many of us on in this NG either ARE or HAVE BEEN dealers and know where we would go to purchase a radio if needed. There are surely others in here that are here to learn and discuss ideas and opinions and advertising spam id usually a good way to get your opinion quickly discounted down to your just wanting to move product. We have people in here that write for radio magazines, are amp builders, electronic engineers, truck drivers , and housewives too. Your wasting your time if you think spam is something that we need in here.

Yes, but this is the fact...

The ITU treaties serve the FCC well, so they will choose to continue to enforce them.

Makes money.

And that is the way it is:

Yes, a large number of hams and something that resembles CB complete
with FM is in use.

There was no reason to address the possible results of a refusal to allow a station inspection. My comments were addressing only the claim, in the message I quoted, that the FCC entered homes without permission or a warrant.

Yes, as I said in another message, you will get a "Apparent Liability for Forfeiture" notice if you refuse to allow a station inspection. But that has nothing to do with your refusal. The FCC already had evidence of illegal operation before attempting a station inspection. The station inspection is designed to either prove your innocence or gather more evidence.

Of course, I have already said this in another message.

The rules concerning CB radio make sense and do exist. I don't see a big difference between the two.

Are you saying that we should change the laws to make the illegal
operation of a radio a criminal offense similar to murder? The rules
concerning radio operation is a civil matter and should remain in the
civil courts.

> > This evidence may include RDF evidence, signal analysis, tapes of

> again, this is what i said before, these things, in a criminal court proceding,
> would be weak at best.

People have been sentenced to the electric chair on far less evidence (sworn statements, taped conversations, etc.). It is more than enough to argue before a civil court judge.

> if i were accused of murder, any analogy of these things could be used to establish probable cause. without the murder weapon with my finger prints on it, (my radio), it is all circumstantial evidence and would be difficult, at best, to prove. under the FCC rules, i am required to give them evidence against me by allowing them into my radio shack to confiscate my equipment. all without benefit of due process and a warrant. the constitution just took another step down.

We've already covered this. The FCC does not enter your home without a warrant. Lets not keep going over the same old ground.

> if the FCC were heald to the constitutional rules of evidence, they would loose 99% of the cases that they would bring before a judge.

They are held to the rules of evidence concerning civil proceedings, not criminal proceedings.

> in a criminal court, the govt. would have to prove it's case without my help. in a civil proceding, i would have to fight to prove my innocence. again, against the constitution.

In a civil proceeding, both you and the FCC would have to present evidence. And each can challenge the other's evidence. That sounds pretty fair to me. And, since the constitution allows for civil proceedings, it is constitutional.

> exactly my point. i have to prove my innocence. if i were to appeal a murder charge, basically, i would go to court and say i disagree with this or that evidence and the govt. would have to prove to the judge the evidence is still valid. in a civil court, no matter if i'm innocent or guilty, the advantage lies with the FCC and the burden of proof lies with me. once again, against the constitution.

That is absolute nonsense, Jeff. In a civil court, neither side has an advantage. Both you and the FCC would have to present evidence. The FCC would have to argue their case against you. And you would have to present argument that supports your position. The judge decides only after hearing both sides of the case.

There is no automatic assumption of guilt in a civil case, nor an automatic assumption of innocence. Unlike a criminal court, where you

are assumed innocent until proven guilty, in a civil court both parties
on equal ground going in (you are not assumed to be innocent or guilty -
you are just a person who disagrees with the another party).

> criminal courts were designed to settle offenses against laws made by the
> government in accordance with the constitution.
> civil courts were designed to settle disputes between private parties that do
> not concern "legal issues".

Civil courts were designed to settle civil disputes between anybody.
That includes individuals, groups, companies, corporations, or
government agencies. There are no laws which place a limitation on the
parties in a civil dispute.

I gave you the benefit of the doubt, Green. I said "even if everything your say here is completely honest..." However, I have my doubts that it is "completely" honest and stated that.

That is a valid opinion considering the absolute nature of your statements. For example, you claim that you "don't bleed on my neighbors TV or any other electronic gear either." Now, unless you have talked to each of your neighbors, and have tested each item of electronics owned by them, that would be impossible for you to know for certain.

Therefore, that statement cannot be "completely" honest. It is only conjecture based on the fact that you have not received any specific complaints.

I'll admit I have never contacted 112 different divisions/countries/terrotories/whatever-you-want-to-call-them.etc. yet with my 2510 on 11 meters, but I do know from looking at other freebander's log books and QSL collections that it IS possible to contact atleast 112 countries/divisions/territories/whatever-you-want-to-call-them/etc with a

> reasonable amount of power.

Sorry Aaron, but you're twisting the argument to support your opinion. He did not say divisions or territories. He specifically said countries. And therefore, I stand by my argument - it is impossible to contact nearly half the countries in the whole world with only a 25 watt radio and an Antron 99 (which is exactly what he claimed that he had done).

> CAN be done.. although I've yet to see proof of it BEING done.

The person claimed to have contacted 112 countries with a 25 watt radio and an Antron 99. Since there are only 260 countries in the whole world, that would mean that he has contacted nearly half the countries in the whole world (on 11-meters and with that radio equipment).

Far more than half of the world is out of the skip capabilities of 11-meters. For example, it would be impossible to contact China with a CB radio in New York. An 11-meter signal simply cannot skip that far

(no matter how much power you are using - and it is absolutely certain
that it cannot be done with a 25 watt radio and a simple antenna).

However, since you have seen "proof" that it can be done, perhaps you
would like to share that "proof" with us. Until then, perhaps you
should be careful who you are calling a "pompus, self-righteous ass."
Someone might apply that phrase to you.

How are you registering the hits? Are you just using a counter? If
so, then why don't you just sit there and hit your reload button over
and over.

Greetings!

Built a lot like the Cobra 148F-GTL point of origin.

Although the bugs have been worked out, I still side with Uniden.

While Dancing with the Mouse on Mon, 15 Nov 1999 00:00:26 GMT, the
Modem interrupted with an MNI from "explorer@voyager.org (John
Jenkins)", and the MotherBoard buffered this to Video RAM:

Greetings!

No, TR34 ALC sense/amp connects to TR25 AMC/ALC amp.

R131 affects TR26 AMC sense/amp.

<Why? This is where it gets long winded. Readers are invited to comment...>

The bad thing about TR26, is the inherent fault of placing the emitter on the AM regulator output line to the finals, audio is always applied to the emitter versus using the base and running it as a limiter versus a regulator in itself when the radios' in AM mode.

It conducts when the base voltage reference done by R131 and R130 affects the emitter voltage off the sense line from AM regualtor. It begins to begins to fall when audio is applied. Falls too far, the emitter of TR26 is at a lower reference voltage than the base, and begins to conduct, pulling TR25s' base low and this forces TR25 to work. By sensing the dropping DC voltage, this circuit operates to prevent negative peaks from forcing cuttoff at the Finals. The forward swing is allowed, but C109 acts as a peak/hold filter that recovers thru a series of set limiter resistors.

It's a cascade effect. Under SSB mode, this automatically biases off TR26 [straight 12V reverse biases the emitter but the collector acheives a high impedance 8 volts to provide a reference to TR25 due to what R131 and R130, along with R129/R128 provide to the sense line].

In SSB, TR34 runs TR25 instead. TR25 conducts when it's base voltage is pulled below the reference voltage R129/R128 gives from the line shared by the collectors of TR26 and TR34.

Due to the biasing of the base of TR26, the collector output is a steady voltage, but at a high-impedance set by R130 and R131 and TR25's R128/R129.

A small change in voltage on TR34's collector affects the collector of

TR26 and the base of TR25, and TR25 acts like a switch and changes it's state [due to the bias reference of R129/R128] and a capacitor 10uF acts like a filter and also something to work against when the charge removed from C109 is recovered due to biasing R128/R129/R130/R131 provide. That in turn forces the AF limiter TR24 to conduct.

In AM mode, 8 volts constant is applied to the emitter of TR34, so any sensing of envelope exceeding a refrence TR34 wants to conduct on, it can't, no current flows because the emitter is reverse biased.

Whats a pain, is you'd think that simply removing TR26 would take care of the problem right? Alas, it's not that way. A voltage needs to be present to make TR25 remain off, and because of the 8 volt constant used to regulate the base of TR26, this is where the ALC works against a set value, and TR25 remains off until TR24 pulls this reference voltage low enough to force TR24 to conduct and limit audio. R128 offers high-impedance to TR34, but will always have a voltage present on it due to the forward voltage drop of TR26's collector to base and R130. So, it will always provide a voltage sense and is why TR26 needs to remain there. The collector to base drop is only .7 volts, but R130, along with R128/R129, gives TR34's sense line some reference, only at a high impedance, and a slight change of this line and TR25 acts like it did before. R128 drains off R129's reference from 8 volts constant.

[condensed from my notes over a Cobra 148 - due to labeling and additional changes, some parts noted above may vary from 148 to 148 ST models.]

There's ways around this of course, but TR24 being removed or R131, is the down and dirty way, except removing TR24 is inherently affecting both modes and is a lot dirtier in results.

Removing R131 takes care of the 8 volt reference TR26 needs, it then remains conducting due to R130 keeping the base reference to ground, but keeping the emitter effectively "off" all the time - no matter what voltage may be present at the emitter. The radio is not capable of dropping that much in AM regulation voltage on the emitter to go below base reference R130 has.

But, due to the bleedoff of R129 from the base of TR25 and R128 and forward voltage drop and bias of collector to base of TR26 and R130, this reference voltage is close to, but not quite at the same voltage had R131 been in place.

Hopefully I have this right...;-)

While Dancing with the Mouse on Sun, 14 Nov 1999 19:24:04 -0500, the Modem interrupted with an MNI from ""Richard Camarata" <rtcamarata@mediaone.net>", and the MotherBoard buffered this to Video

I think we are peaking out by the middle of next summer. However, February-March are typically gangbusta' skip. Even at the bottom of the sun spot cycle there are openings. The farthest I've got lately were south asia and south africa. The regular 40 channels are hopeless though. It's pretty much impossible to break through the garbage unless you are runnin' some big amplifier. 27.555USB (channel 55) seems to be the calling frequency and stations QSY from there. This is quite illegal, of course. I've had the best luck in the early morning myself. Skip seems to switch from east/west to north/south as you get later in the day.

MC 10kw Jesus,

You are totally correct, a 1/2 wavelength line of coax does
present the impedance of the antenna feedpoint back to the radio.
Also, you do a good job describing how to accurately prune
your coax line to a certain wavelength. You also accurately
state that the SWR would be 1.3:1 on that mobile antenna.
(more accurately, the 102" whip - shorter whips have
a lower impedance (than 36 ohms) and have a greater mismatch).

You totally commit the crime saying the 1/2 wavelength
of coax is magical and is capable of raising performance!!!

MC 10kW Jesus wrote:

>
> Size does matter......how to trim your coax for best performance.
>

You seem to miss the point that the impedance of the load
the finals "sees" DOES NOT have anything to do with SWR. The real
mismatch condition occurs at the antenna feedpoint -
like I have said 10 million times. Try thinking for yourself.

SWR is a ratio of forward to reflected power -
how much power is going down the coax and how
much is being reflected back - is constant
at all points on the line.

I used to share your exact beliefs until
I studied this closely and asked lots of questions.
This exact conversation has occurred a million times and will occur
a million more - but I won't be happy until
you really understand it.

If you don't believe me..here is some more supporting
facts...here is the same (huge) conversation with some real
antenna experts....you can find this on by searching
past posts on deja news. This thread was the best
thing I have ever read anywhere.

> Isn't it true that if coax isn't terminated (loaded,
whatever you
> want to say) in its "characteristic impedance", the

> impedance
> at the feed end will be a mix of the antennas impedance components
> and some added components of the coax?

Actually, it's the antenna impedance transformed to a different value by the transmission line. The transmission line length and impedance as well as the load impedance determine what you see at the input end. In that sense it's a "mix" of the two impedance's.

> I am pretty sure
> that at 1/2 wavelength multiples on the coax, the impedance
> components of the antennas feedpoint (resistance and reactance) are
> mirrored (without additional impedance components of
> the coax).

Yes, as long as the feedline loss is negligible, this is true.

> Since the impedance components change as
> the coax length varies, why doesn't different mismatch conditions
> occur right at that point?

One value of SWR can be the result of an infinite combination of impedance's. And these are just the impedance's you see along the line. Take, for example, a (lossless) 50 ohm line terminated in 25 ohms. At the load, the impedance is 25 + j0, which calculates to an SWR of 2. 1/8 wave toward the transmitter, the impedance is 40 + j30 ohms. This also is an SWR of 2. (The calculation for SWR, given a complex impedance like this, isn't as simple as some people assume. You can find the equations in the ARRL handbooks. Notice that this impedance 40 + j30 has a magnitude of sqrt((40)^2 + (30)^2) = 50 ohms, but the SWR is 2.) 1/4 wave from the antenna or load, the impedance is resistive again, 100 + j0. SWR = 2. Another 1/8 wave back (now you're 3/8 wave from the load), and the impedance is 40 - j30 ohms, still 2:1 SWR. And 1/2 wave back from the load it's 25 + j0, right where we started.

A really great way to visualize this is with a Smith chart. You start with the impedance at the load and go around in a circle, with 360 degrees of circle representing 180 degrees (1/2 wavelength) along the line. All points on a circle on a Smith chart represent the same SWR.

> radio----SWRmeter[A]-----------------------<Antenna
>
> As an example, say the antenna is *not* 50 Ohms (who ever
> really gets their antenna to be 50 Ohm purely resistive, anyway?).
> And the impedance measured at point A is, lets say 59 Ohms.
> If we shorten the coax length like this:
>
> radio-----SWRmeter[A]-----------<Antenna
>
> The impedance at point A would change, wouldn't it?

Yes.

> Wouldn't SWR vary, because of the mismatch at point A?

No. Although the impedance is different, the SWR is the same as before. Remember, given a transmission line impedance, an impedance represents just one possible SWR. But one value of SWR (except for 1:1) can be made from an infinite number of impedances. As it turns out, the impedances that make an SWR of, say, 59/50 ohms are precisely those impedances you find along a 50 ohm line terminated with a 59 ohm resistance.

> Lets assume the SWR meter is good, and has an impedance
> of 50 Ohms.
>
> Or, will the SWR in fact vary? Are there two places
> where standing waves setup (at the antenna feedpoint and
> at point A)?

As you go along a mismatched line, the ratio of voltage to current along the line go up and down (that is, the magnitude of the impedance goes up and down), and their relative phases change (that is, the phase angle of the impedance changes). If the line is at least 1/2 wavelength long, the SWR is the ratio of the highest voltage along the line to the lowest. (It's also equal to the ratio of the highest current to the lowest.) At any point along the line, if you look at the impedance and calculate the SWR, you'll find it to be the same. (Again providing that the loss is negligible. If not, the SWR decreases as you go toward the source.) The standing waves (these increases and decreases in voltage and current) are really the sum of two (or more if you like) constant-amplitude, constant-phase waves going in opposite directions.

What you really need to do is read _Reflections_ by Walt Maxwell, W2DU. It's currently out of print, but I know Walt is working on a new edition. I hope it's out soon!

Roy Lewallen, W7EL
ARRL Technical Advisor

In other posts here it is correctly discussed why an SWR meter can vary with line length - but
it is totally false to say 1/2 wavelength multiples make SWR more true or improve performance.

BoB.

I'm considering getting a Moonracker or similar ie Maco Shooting star beam.
Anyone have specs. on either of these ? ie how long the elements are ?, the
weight of it ?
Also do these type of beams need a rotor that can adjust the beam angle
(azumith) as well as the direction ? And finally any comments or opinions if
either one is better than the other.
I'm looking to increase my distance locally, and also want to get into DXing
on ssb and 10 meter.
TIA

Heya All,

Check out this really funny easter egg, which I was told about recently!

First - Go to http://fly.to/dogbomb (this is a personal homepage of some guy)

Click along to his [picctures] section...

Click on his NOSE in the TOP picture!!!

Et Voila!!!

Cool Huh?

AceHump

: possible, so any evidence to support that claim would obviously have to be
: fake.

As I posted before - you need to have a serious talk with a few of the
QRP Hams around.  I assume that you would believe Ham operators, as you
do not seem to believe that CBers can tell the truth.

Ask them about how many countries they have worked on 10 meters, running
under 10 watts of power - possibly even less than 1 watt.

Rad shack don't sell crossbows any more.
What they do sell looks alot like the antron99.

(ie) 3 section fiberglass radiator.
Dual tuning rings.
17 1/4 ft tall
2000 watts max

It has a ground plane kit with radials
that are 6 ft long

Sounds like a a99 to me

21-869 for $69.99

and the gpk rsu 12133914 will go for $29.99

Storm (Stormtracker@worldnet.att.net) wrote:
: I'm considering getting a Moonracker or similar ie Maco Shooting star beam.
: Anyone have specs. on either of these ? ie how long the elements are ?, the
: weight of it ?

Both the Moonraker 4 and the Shooting Star have a boom length of about 16 feet. If I recall correctly, the longest element is slightly longer than 16 feet.

: Also do these type of beams need a rotor that can adjust the beam angle
: (azumith) as well as the direction ? And finally any comments or opinions if
: either one is better than the other.

No, all you need is a direction rotator - unless you plan to work Moonbounce.

: I'm looking to increase my distance locally, and also want to get into DXing
: on ssb and 10 meter.

Get a switchbox and use a vertical for most local communication. It is a pain to swing the beam for any communications that can be completed using an omnidirectional antenna.

If you are considering Wilson Antennas, I suggest that you buy them quickly. Wilson Antenna Company is out of business. They sold out to Barjan, and the manufacturing will soon move to China. When it does, the quality will plummet, and so will the performance. Just a note in passing.

Currently I have a Texas Star 667V. I was looking at buying a Storm Built amp and having a variable output, and a receive preamp installed in it. The receive preamp is a 30db variable gain type. The amp itself is a 5 pill, all 2879's. Question is should I buy the Storm and sell the T.S., or can the T.S. be built up to get a comparable output of the Storm? What kind of gain does the preamp in the T.S. have?

Near Mint Yaesu FL2100B for sale on Ebay
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=201033603

Near Mint Condition FL2100b in original box. This unit is VERY nice. Still has the plastic film cover on the faceplate! Checked out by Tech. Works great! ...but due to electronics sold as is. Also has original owners manual. Must sell, as recently injured awaiting Spinal Fusion Surgery and out of work! Buyer pays shipping/packing from 67211-4833. Money Order and Cashier Check.

Okay Jeff, I read all that Martin has said. How does any of that support anything that you have said in this newsgroup? And how does any of it contradict anything that we have said in this newsgroup?

And, while you're at it, perhaps you should also tell us why Martin's opinions (the opinions that you say supports what you have said) are more valid than any of the other opinions posted in this newsgroup.

Perhaps you should invite Martin to this newsgroup to read some of the messages you have posted. I doubt he would be so friendly afterward.

Browning Golden Eagles for sale on Ebay.
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=201021286

Browning Golden Eagle S-23 Transmitter with very RARE receiver. This is the only one of it's kind that I've seen. The receiver has the "large" meter like the Mark III's. Excellent Condition. Been checked out by a Tech. At least 9 on a scale of 10. The best one of it's kind I've ever seen. Works great, but because of it's age sold as is. Must go, as I'm off from work injured awaiting spinal fusion surgery. Buyer pays shipping/packing from 67211-4833. Cashier Check or Money Order.

There's a TV station where I live here in Chicago, called UPN Power 50 that
broadcasts with 5 million watts... (!)
Boy, I'd love to be the one to key up that transmitter when they go on the air
every morning...

>BTW Dave, a 50kw station is a small station.  Most FM radio
>stations in the US are 100kw.  Most TV stations are 2 mega-watts or greater.
>Most VOA (Voice of America) stations are at least 25kw, some 100kw and
>larger.

Toll,
>The 3CX15KB7 would have a hard time holding it's own with a 4CX5000R tube.
I have a 3CX3000A7 and a 3CX2500F3.

I do not have the 3000's data sheet to hand but remember reading the wildly different output power of these two. It's as if Eimac destined two different jobs for them.

What is your professional assessment?

Which one should I keep, which one should I throw?

I only intend keeping one for a long term project as a mobile 'daily driver'.

By the way, while we have these wonderful conditions I intend to trailer out a mobile pump up mast (60ft) that I have together with 5-ele Long John and the Pirate 8-pill that Dennis #12 modded. Should give me a conservative 10KW effective power.

I'd like to attempt to punch a small hole on the bowl. You'll have to let me know what times you listen at weekends. If you carry a mobile phone e-mail the number and I'll ring you from my car when I'm set up.

My mobile will look like Pee Wee's!

Phil / UK

>something out here but I guess its not going to happen.
My thoughts on this, and I'm no expert is that if you want your amp to
run a higher duty cycle then it of course stands to reason that you need
the power supply to match.

In effect this setup will probably cost you more money in terms of
alternator/battery for any given power output.

It all goes back to the drag race scenario. The Hemi will stay together
for 6 seconds but not 8!

Dave,
It is a 10 meter ham radio. It comes with a 200 watt linear. It is a very sensitive radio. It hears and talks far but is not a good radio for up close use. I mean within a football field or so. Took mine out of the pickup because I couldn't talk to my customers up close. Now if you are looking to talk long distance on 10 meter then this is a good choice. It has a LCD readout.

There might be a 10 Meter person out there that can mod it for you to get that sensitivity down.

Good luck

My point exactly!

I am thinking...

"Bullhog Suburban"????  Not many people can compete with that cottonpicker!

Toll Free

That statement, put simply, is not true.

I have contacted Moscow before..

How is that possible?

It is "out of skip range" of 11 meters?

What a crock. Skip is skip, is skip.

Their is no magical "range" that 11 meters will not skip too.

> So if I live on a state border, and I start talking, my sound waves
> will cross the state line.

No, the radio waves will.

  Does the federal government have the right
> to control my voice?

They are not controlling your voice.

The are controlling the medium of transmission.

Of course, living on the state line, you would be able to scream, and then
in turn, be heard.

However, then the local authorities would have jurisdiction, and they would
bust you for disturbing the peace!

I see your point, but fact is fact.

toll every time i tried to stop this kid shit i found anouth post by you so
i keep playing your game. Im actually starting to like it.
And from the Emails I have been getting from people I can tell you dont have
as many fans as you think you do.
you ask why i pick on bigradios? you started that shit with my site and a
few people told you they like my site better now you want to change the
subject?
toll im done when your done but every time you try and attack i wont let you
try and make me look small. Like ICM said jersey definitely has got it going
on.

hi dwight, i sent you proof of contacts from about 30 different countries just because i happen to have those on hand photocopied. as you seen some were from the pacific, others where from africa, and even europe. i think you should know before you sound even more uneducated, there are 340 dxcc countries plus or minus 10 all counted as soveirgn nations by the fcc, dxcc, rsgb, and the arrl therefore i consider them the same way as do all radio operators on the ham bands as well as 11 meters. guess what? people in new york do work china all the time, they just point there beams north and talk over the pole. here you are asking for more proof. how much can you want? you really need to give this one up dwight, but i guess you cant tell when your losing.

now your splitting hairs, sorry if my lingo confused you since your a no-code
tech. 1 dxcc = 1 country for all radio purposes. like i said before there are
about 340 seperate radio countries. here is a direct link so you can see for
yourself, for example if i work tahiti (sent you a copy of that card too) it is
considered a totally different country than france for all radio purposes even
though its only a french territory. getting it now? check out the link so you
can stop posting un informed shit.
http://home.t-online.de/home/IRDX.GERMANY/prefix~1.htm  follow this link and
youll see what i was trying to say. i have 112 dxcc confirmed and thats a very
small number compared to serious dx men in europe. mine would be higher but i
stopped collecting qsl's last cycle.

>> I'm sorry, but I do not buy this.  As a matter of fact, I know for damn
>sure
>> this is a crock o crap.  I'll admit I have never contacted 112 different
>> divisions/countries/terrotories/whatever-you-want-to-call-them.etc. yet

Currently this cannot be done legally, it would require changes that the FCC put into effect a long time ago, all 40 channel radios have a fixed transmit on SSB and over the years it has gotten harder to make the changes to a radio, so now all manufacturer's will have to redesign their radio's but this can only be done after you get the FCC to allow for this. Was a stupid idea to begin with but what do you expect for the government.

The bottom line, if you're ever "busted" by the FCC for running a 100% legal station, then I'll listen to you cry foul and consider your paranoid points. I've never heard of anyone busted by the FCC, who was running a legal station. They have their hands full as it it is, keeping up with the radically illegal operators, they're not going to waste their time going after legal ops.

If you are busted for running illegally, then you deserve what you get and I have no sympathy for you.

It's one thing to cry "unfair!" if you are wrongfully prosecuted. But don't promote illegal radio operation, and then try to cry foul when it all blows back in your face.

In the unlikely event that this would happen, why would hams complain? Most hams follow the rules that they are supposed to follow.

You are once again displaying that persecution complex. Hams are not hiding behind your bushes, and in your closet, plotting the end of the CB band. The ARRL is a lobbying voice, that has some pull with the FCC with respect to HAM RELATED ACTIVITIES, but nothing else. Yes, the ARRL is made up of all hams, because it is a HAM ORGANIZATION (duh!). The FCC officials may be made up of some hams as well, as it makes sense that people who work around radio, tend to enjoy a radio hobby. That does not mean that they are predisposed to dislike any other service.

CB radio (once again for the slow learners) was never designed to be a lawless version of ham radio. There are specific rules that are to be followed. Why should the FCC lend a sympathetic ear to the cause of the CB band, when a great many of the users, display no desire to follow the rules of the service? You keep fighting the system from the outside, and you wonder why you never get anywhere.

If you want to try to rationalize and justify the reasons why you blatently break the rules of Part 95, then so be it. But don't cry if you get popped for it. You take your chances....

What Constitutional rights do you have, that are being walked on? The
FCC is a recognized agency, responsible for regulating a natural
resource (the airwaves). Follow the rules, and you have nothing to fear.
Or are you saying that the FCC does not have the right to enforce the
rules that they mandate? Maybe you feel the same about the local police?

Your complaints and constant whining are no different than cable TV
pirates, pornographers, or any other petty criminal, that cries that
their rights have been violated when they get popped for violating the
rules. It's so unfair that they can't be allowed to operate above the
laws that eveyone of the rest of us have to adhere to. so tell me then,
WHAT MAKES YOU SO DARNED SPECIAL?

Right, so now you want an "exclusive" lawless band, so only wealthy
people can ignore part 95.

> it is all of this "air pollution" that causes more problems than all of the

> across the street in some areas.

Then why do so many of these people keep their amps on 24/7 even when
the band is quiet?

Maybe if the lawless people were removed, the band would be clean again
for the people who the band is intended for.

If every CBer were operating legally, there wouldn't be nearly the
complaints, as the amount of interference from a legal station would be
several db below the high power stations.

>
> >4
> >watts is not only enough for what the band was intended for but also

No, the majority of the lawless types (other than the srict
freebanders), don't like to run sideband, because it is tougher to
operate, and doesn't lend itself well to the "loud and proud" mentality.
SSB is a better mode for a true DXer though.

I understand the problems that are on the CB band (I've been there for
30 years). I understand that there are many people that have "taken the
law into their own hands", in order to be able to enjoy a radio hobby.
But you need to understand that the government is not likely to be
sympathetic toward people that openly disregard the rules.

Ham radio is "about" communications. Ham radio is not about "king of the hill" power contests. You seem to convey a considerable preconception of ham radio for someone who isn't part of the group.

Power won't help you, if you can't hear anything. Most hams tyry to deal with noise, through receiver enhancements, such as DSP, notch filters, adjustable bandpass, and audio filters. Something you won't find on your $30 CB.

It's true that RF doesn't recognize territorial boundaries. That is why the ITU exists. There is great pressure for all countries to belong to the ITU. It benefits all countries to have the protection from interference, that comes with mutual compatible frequency assignments.

>
> >Secondly, you have an unrealistic view of how hams operate.

I'm allowed to run 1500 watts. Guess what? I don't run over 100 watts on HF and 200 on 2 meters. I don't need the hassle, and the TVI problems associated with high power. And I've never had a situation where a station that I was talking to needed me to "crank it up" any more than I already had.

>
> >As if power solves everything. Truth is, most hams don't even own an

> most of us would be happy with that and some of us are.

Many of you "freeband hobbiests" would, in fact be happy with that. But the rest of the "loud and proud" crew, would not be happy with a mere 100 watts, and they would break that rule as well (assuming that the FCC created a 100 watt legal "freeband"). Of course judging from all the negative reactions to strictly SSB-only modes, that may be enough to keep the riff-raff off of the new band. Make it SSB only and you MIGHT make it work.......

The "border jumpers" are relatively new to the 11 meter scene. I never remembered hearing the sheer amount of Spanish speaking DX back in the early 80's or in the 70's. I doubt if they were a problem for 11 meters before CB.

> lot for shooting DX because it has more frequent band openings that
> most other bands.

What?!? 11 meters is virtually identical to 10 meters in DX propagation. And that propagation is dependent on active sunspots to be usefull or frequent. Other ham bands, that are lower in frequency, have much more consistent and predictable DX conditions. When the sunspots are high, you can't beat the DX on 10/11 meters, but when it is low, the DX is not there at all. 20 meters has DX almost any time, as does 40 and 80 meters.

11 meters also had interference from ISM devices that were also assigned to the band. This made the band less desirable than 10 meters.

11 meters was also an oddball in harmonic relation to the other bands.

Look at the other ham bands 80 meters is twice 160, 40 is twice 80, 20
twice 40, 15 is 3 times 40, 10 is twice 20. This makes antenna
resonances easier to make for multi-band operation, as well as crystal
frequency synthesis. 11 meters does not conform to any of these schemes,
so special antennas or tuners had to be used, as well as special
oscillators for frequency generation.

Then you and your buddies should all get your ham tickets and you'll be
100% legal, and there would be no problem. It will be hard to justify,
in the FCC's eyes, the creation of a "mirror" service to ham radio. The
only reason that I've seen from you guys against joining ham radio, has
to do with some perceived personality stigma, most of which is
exaggerated well beyond reality.

>
> If it's good for you guys it's good for us.

That's where you're wrong. Hams have to take a test to demonstrate that
they understand what they are doing (even if the test is administered
like a joke). Most CBers wouldn't know the difference between a class C
and a class AB1 amp, unless their local "tech" tells them.

> According to the ham test
> study book I have even the no-code tech class hams can run 1500 watts
> on all bands they have rights to if such is needed to get clear comms.

Not entirely true. 10 meter operation is limited to the novice power
level of 200 watts.

> I fail to see any difference between that and what the vast majority
> of CBers who use amps do. Contrary to what you obviously think, not
> every amp using CBer runs a "splatter box" as I've seen em called in
> this NG.

You have to distinguish between groups of illegals Cbers. Freebanders,
who run a majority of SSB, require and tend to understand the need for
"clean" amps. Freebanders tend to be a bit more knowlegable about such
things. On the other hand, the "king of the hill" loud and proud types
that run on the regular 40, don't care much if their amps splatter.
Class C will usually make a few more watts, and that's all these guys
care about. A class C box can also be used as a "modulator" and can
enhance (if not completely distort) the "swing" aspect of the
modulation. All of this results in adjacent channel splatter, and RFI
problems.

The simple fact here is that in the eyes of the FCC, their reckless
power operation overshadows the freebanders more conservative
application of power, and you all suffer as a result.

> If I look up at my modulation meter and it's going over into
> the red it's time to retune my equipment. I've got neighbors who run

> CB's less than a mile away, and even on the rare occaisions that I run
> max power they never get any bleedover from me. That's because I like
> most amp users, run my equipment clean.

You are not "most amp users". "Most amp users", in my area, run dirty competition class "C" amps with clipped, swing kit installed, garbage radios, and splatter 100 Khz in either direction.

> Stopping all amp usage just
> because some few morons run amps with several 500Z tubes driven so
> hard that they throw purple lightning around inside the glass is just
> as stupid as banning high performance automobiles just because some
> few morons can't seem to control them and keep wrapping them around
> trees or other people.

Bad analogy. A high perfomance car has the potential of injury if wrongly driven, and laws are written to protect the public from the idiots. A "high performance" Cb also has the potential to injure the operator, if misused, and to disrupt the communications of other people. That is why rules were written to address this.

> Facts as far as what was made public. Think about it. It's plain

> been happening between CBers and Hams since 11 meters was allocated
> for CB.

You were right in the period the immediately followed the "taking away" of 11 meters from the hams. There were (and still are) guys that might never even use a band, but will piss and moan if it's taken from them. It is human nature. However, most of the hams that were active then are either inactive or dead now. Most current hams are not fighting the "incentive licensing"/ "loss of 11 meters" fight any more, except on a few of the geriatric nets.

Many newer hams don't even know that 11 meters was once a ham band.

Has it ever occured to you that the Spanish-speaking DX stations are
just Latin America's version of a lawless Cber? How do you think OUR CB
band sounds to them?

I find it ironic that you bitch about the lack of enforcement of Latino
stations, yet advocate that we (in the states) should be allowed to
ignore the rules.

FWIW, Latin' america's version of the FCC needs to crack down on their
problems as well. But that doesn't excuse us from the same
responsibilities.

> I don't trust ANYTHING the gov't says. These are the same people who make attempts to ban guns when all of the data shows that the stricter your gun control laws are the worse the violent crime rate is. These are the same people who refuse to ban products that have been the direct cause of many thousands of doccumented deaths but ban things like red M&M's because cancer showed up in some lab rat when it was force fed enough of that dye to cause it's fur to turn red. It was years before M&M Mars was able to find a different red dye that matched the orriginal color and passed the gov't approval. These are the same people who waste billions of dollars on a so-called war on drugs that has gone on for years with no noticable effect on the amount of drug use. In fact, drug use has increased instead of decreased.
>
> And I'm supposed to believe what these folks say? Especially when it's supporting some law they've passed without my having a chance to vote on it? It'll be a frosty day in the under-regions before that happens.

So, you refuse to accept data due to a government paranoia, and instead choose to believe your own "insticts", which have no basis in fact, or evidence to back it up. When you are diagnosed with brain tumors, sometime in the future, think back to this thread, and tell us again, how there is no RF field exposure danger.

Boy, if ignorance is bliss, you must be very happy.........

Oh, we manufacture the electromagnetic spectrum? That's news. We may
make the devices that use the airwaves, but electromagnetic propagation
follow the laws of physics and as such, are natural.

Two words. "Implied Consent". In the issuance of the PRIVILEGE to drive as well as operate a radio station, as a condition of license for this PRIVILEGE, you acknowlege that if you are pulled over for an alchohol test (or an inspection of your radio station), as a condition of the granting of the license, you AGREE to allow them to take the test (or inspect). Failure to allow this, invalidates the license, and your PRIVILEGE is revoked.

You can try to Perry Mason the heck out of this all you want, but the rulings stand. If there weren't so many people like you, that try to beat the system at every turn, these laws wouldn't be necessary. What good would a blood alchohol test be if it weren't administered promptly after the violation? Without the blood alchohol test, there would not be sufficient evidence to convict a drunk driver.

Likewise, if an FCC official were denied immediate access to a radio station, the ability to catch an offender, before he's had a chance to "clean up the shack", for the purpose of evidence gathering, would be rendered inneffective.
You want to cripple the actions of law enforcement, so that scofflaws like you can continue to thumb your nose at the rules. The constitution is only a crutch, that you try to swing to try to support your case. The rest of us can see the real truth clearly though.

It's not a violation of your constitutional rights, since when you sign on the dotted line, you AGREE to it. If you don't agree, then you don't get the license. If you have some weird, far out reason why this implied consent would prove a hardship to you, you can try to apply for a waiver. If you can provide sufficient evidence supporting your case, maybe you'll get it. But you have to try up front, not after a citation.

He's not crazy!  Just anyone who buys it is!

Like that commercial for IBM printers.  "It's only 3 million dollars.
It's
mostly right.  Well, isn't that kind of expensive?  I only have to sell
one!"

Mike

I have one I use as a driver.. It is a one driving 3 6lq6 amp made by Demco I think?(Toll?). turn it on and warm it up. Start on Slave mode. Flip the amp into operate. Dead key on AM and adjust the Drive ,Tune, Load for max power out. Now modulate your radio with voice or a whistle and retune all the controls for peak power. You should end up with 450 peak from a 100 watt carrier if it works like mine. Master mode is just a high setting. My amp on Master keys up 250 and swings 550. I always run mine on slave(low) as it is much louder and easyer on the amp.

Not another guy that thinks Cranking the AM carrier power adjustment actually helps him! Leave the carrier adjustment alone and turn the AMC up or cut R131 and put the cover back on..

with the front of the radio towards you (component side up ofcourse), it will be on the right side of the board,now start looking in the area of the side closest to you (front-right hand),it is a lil less than half way up the board(from front to back).just look for components near it until you zero in on it,once you find it the first time it will most likely stick in you head were to find it.good luck and 73!

I was thinking of Broadcast band AM stations. The ultimate question is: IS
the FCC there for our GOOD, pursuant to Romans 13 OR the 6th plank of the
Communist manifesto, or are they an UNConstitutional alphabet soup agency,
like the EPA (Gods that our fathers never served or new) , or are they just
there to prevent damage (interferance to commercial Babylonian stations,
like the 52-890 mhz "Devilvision.")   God forbid if CB TVI jamms that TV
trash!!!! Dave!!!

If you havn't checked out the CB City message board lately, you may want to stop by and do just that.

There are lots of radios, amps, and just about anything radio related in there, and you will be surprised just how much there is in there.

Have a great day.

My first CB (other than walkie-talkie type) was a Cobra Cam 89, bought in 1975. Ran it with a Starduster antenna and the Radio Shack desktop power microphone - I was going to buy a Turner mic for it, but a guy half a dozen or so houses down the street bought one of the Radio Shack ones, and when I compared the schematics for the Turner I was looking at and the RS one he'd bought, they were identical. The RS one, of course, sold for about $30 less.

73 and good DX'ing,
John D. Kasupski

when i told the news group about having 112 different dxcc countries confirmed a lot of people thought it was un true but its not. a lot of it has to do with knowledge of the band and what countries are where and what mode they use. maybe this list will help others work some of those hard to reach places. this is the most complete and accurate list there is to my knowledge.

Does anyone have a copy of modifications for the President Zachary T. Base? I have looked everywhere and can't find them. If you have a copy or if you know of a site where I can get them it would greatly be appreciated. Thank you very much !!!

Ok, first things first- I had to read the jokes posted by Cold as Ice.
Next-- I will sign my full name (several bobs here).

Now for the antenna. Everyone has guessed by now that it has to be a wire antenna to be cheap. It is a simple dipole configuration using 450 ohm ladder line, no transformer, and normally, no tuner. I didn't intend to say or imply that the transmission line tunes the antenna itself, but rather, the antenna *system*. The SWR at the feedpoint will remain constant at a given frequency (and will probably be high). It can be strung up in normal dipole fashion, vertical or inverted "V". This antenna is low loss, meaning that it will radiate a high percentage of the power supplied by your station. The neat thing about it is that you can feed low loss 450 ohm line with a 50 ohm system without the need to transform impedances. All that is required is a 1:1 choke balun (no transformer or impedance matching loss) to couple coax to balanced line. Of course, a tuner can be used if you want, but it will introduce some loss. The length of transmission line directly affects the resonance of the system. The dipole length can be 1/2 wavelength or longer.

All that is required is:

-- enough wire for the dipole + insulators   almost free at Radio Shack
-- a roll of 450 ohm ladder line   AES summer 99 lists 100' 18ga for $12.95
-- W2DU 1:1 non-transformer choke balun   "   "   "

"   the HF model for $26.95
-- coax from balun to station   to connect the
balun to the radio
-- Ladder-Loc (optional)   secures the
450 ohm line to the dipole-- $12.95

This antenna works very well, and is great for radio operators wishing to build/experiment with antennas. It is especially good when long runs of transmission line are necessary. It will not be practical for everyone. The HF balun works from
1.8 to 30 MHz. The VHF model works from 30 to 250 MHz.

The drawbacks are:
-- How to string the thing up with the line coming away at 90 degrees
-- Wet weather will affect the resonant frequency and will require changing transmission line length- or by using a tuner till things dry up.

For details, see Cecil's (W6RCA) web site
http://www.bigfoot.com/~w6rca
Select W6RCA's No-Tuner All-HF-Band Antenna
His basic program will calculate the length of ladder line needed to find the low impedance/high current points necessary to feed a 450 ohm system with 50 ohms. Pick a convenient length from those available, add some to be safe, and then start cutting back to resonate where desired. One length should work for all 40 cb channels in dry weather.

I didn't proofread this, so please excuse my speling.
I hope that I didn't miss anything- let me know if I can help.......

Hey, you have the same catalog I have. :-)

Actually, it is the Solarcon A99 - right down to the stickers on the base to the yellow tip on the top. I wonder if Radio Shack left the Solarcon sticker on, or replaced it with their own sticker.

And the price is not too bad either - about the price of the A-99 from most mail order sources with shipping added.

why dwit so you can tell him it was a rhetorical statement when he offers to show proof. For you to say an 11 meter signal cannot "skip that far " you had better learn about propagation before you come out here talking your stupid bullshit. We are not as dumb as you look.

>Toll,
>>The 3CX15KB7 would have a >>hard time holding it's own with a >>4CX5000R tube.

Keep in mind that a 3CX15000B7 tube was built for efficiency and low operating cost. They are used in 30KW FM transmitters everyday of the week 24hrs/7 days a week. A 3CX15000A7, or any other directly heated cathode tube requires very much drive power and mega filament current. The A7 requires 100 amps of filament current where the B7 only requires 15 amps. The A7 also requires 1KW or more of drive power for full output where the B7 only requires 400 watts. This saves on operating cost and the hardware required to drive the amp. The directly heated cathode tubes are a good choice for a rugged tube that can take a bit more abuse but it is costly to drive and to heat the cathode requiring much more current. They are probably used by many of the CB amp builders because they are less expensive, and are more forgiving in poorly designed RF decks using sub-standard parts. Either way any of the large Eimac (now owned by CPI) ceramics are a good bet to go with and will do big CB power. You might use cost and availablity for your overall determining factor. I like the 3CX3000 because they are cheap, can take a beating, and will do 10KW. They work great on the lower ham bands but the problem on CB/10 meters is they are prone to VHF parasitics and if they are not tamed will cause premature failure due to cathode/grid sputtering. This is when the VHF/UHF parasitic causes the cathode to over heat and some of the trace elements (gold&BY if I remeber correctly) boil and become airborne and cause a cathode to grid short. The easiest way to fix this problem is to build a good parasitic suppressor at the frequency of the parasitic and swamp the input. Most dont swamp the input because the inefficient directly heated cathode tubes require so much drive already that they dont want to loose any drive power in the swamping network. Many amp builders sum up tube failure to operator error or beating the tube beyond specs but parasitics are the #1 reason of ceramic tube failure. A quick way to check your amp for a parasitic oscillation is to get a long plastic stick and attach a neon lamp to the end of it. Carefully key up your amp with the top cover off

and bring the neon lamp close to some of the parts, suppressor, plate cap, tank circuit, DC blocking cap, Plate choke,etc.
The neon lamp should light up orange in the presence of HF energy-this is normal. If it lights up purple or blue you have VHF/UHF energy in the tank circuit. You will normally see a little of this in the parasitc suppressor but a properly designed amp will not have this anywhere else. If you find a parasitic you should detrmine the frequency and rewind your suppressor for that frequency. Be careful when doing any of this because you are dealing with LETHAL and DEADLY DC and RF Voltages. If you are not qualified to do this or even feel a little reluctant to- DONT! (thats the standard disclaimer just in case any of you guys try this and vapor lock in the process) Have fun amp building!

Jim

> Keep in mind that a 3CX15000B7 tube was built for efficiency and low
operating
> cost.

They where also built for a 15Kw transmitter... Nothing more.

Look at the specs.

Do the math.

They can't hold their own with the "other" triodes of equal dissipation.

They are used in 30KW FM transmitters everyday of the week 24hrs/7 days a
> week

Name one commercial (Harris, Gates, Collins, Henry) 30Kw transmitter using the 3CX15000B7 tube?

The other tubes of 15Kw dissipation will do it, but the B7 tube is only going to give you 15Kw output! At least, operated within ratings!

That, and the grid doesn't have the dissipation necessary to get the drive level up high enough.

And, the cathode doesn't have enough emission capability to do 30 grand!
Their is a reason that the other 15Kw tubes have 100A on the filament!

. A 3CX15000A7, or any other directly heated cathode tube requires very

> much drive power and mega filament current. The A7 requires 100 amps of
> filament current where the B7 only requires 15 amps.

Because at 14.?? Kilowatts of output (which is what it is rated at), the fil
/ cathode doesn't need to give off that many electrons.

The A7 also requires 1KW
> or more of drive power for full output where the B7 only requires 400
watts.

It takes half the power input because it is outputting half the power!

> This saves on operating cost and the hardware required to drive the amp.

Agreed... And 15Kw is nothing to sneeze at!

The

> cost and availablity for your overall determining factor.

The BIGGEST reason people are running the 3CX3K tubes is because of their
availability on the surplus market.

If the CB amp craze continues, keep looking and you will find the 3CX2500
tube being sold. It is starting to hit the surplus (medical pulls) market,
and has the same dissipation on the plate, but a somewhat lighter grid.

I like the 3CX3000
> because they are cheap, can take a beating, and will do 10KW. They work
great
> on the lower ham bands but the problem on CB/10 meters is they are prone
to VHF
> parasitics and if they are not tamed will cause premature failure due to

Easily handled by simple tricks like Nichrome wire in the plate leads,
decent straps and other things.

This is when the VHF/UHF parasitic causes the cathode
> to over heat and some of the trace elements (gold&BY if I remeber
correctly)
> boil and become airborne and cause a cathode to grid short.

This was the problem with the "bad" runs of the 8877 tube in the 80s and
early 90s.

I, among many, never got over it, and we shy away from the 8877 tube.

The easiest way to
> fix this problem is to build a good parasitic suppressor at the frequency
of
> the parasitic and swamp the input. Most dont swamp the input because the
> inefficient directly heated cathode tubes require so much drive already
that
> they dont want to loose any drive power in the swamping network

Actually, they don't want to do this for other reasons, as well.

Most of the CB amp builders consider the "extra" thousand watts of
feedthrough / overdrive / whatever you want to call it necessary because of
the "watt wars" that they must fight in order to stay in business.

If you lower the drive from a 3CX3K tube from 1500 watts to 750 watts, you
only loose slightly over 1500 watts of output...

And you drop the drive in half!

Figure that out.

Overdrive, harmonics and feedthrough power!

. Many amp
> builders sum up tube failure to operator error or beating the tube beyond
specs

Why would you want to"get that sensitivity down"? Selectivity and
sensitivity are 2 different things,they can interact with each other but
you want both to be as good as possible.

You run a shop,you should know that.

Any antenna intended for the band(10 or 11?)should work,I prefer Yagi
type beams the longer the better.Used ham tribanders work great
especially the good strong ones like a TH6DXX or a KT34XA

Tim, I know there are some big radios in Texas everything is big there but
realisticaly I don't think 32 pills are used for drivers since lots of the
guys are in base stations, and almost nothing would require that much
drive and if it somehow did they would be better of using an ac driver with
1 alternator rather than a 32 pill with 3 or more alternators and a load
full of batteries. plus the driver for the 32 pill and the alternator to run
that.

Tim <zeroeightytwo@aol.come> wrote in message :

You need an VSWR (SWR)meter then you can check your ant from the shack
end of the coax.the short/open thing you did will give you different
readings with different antennas 1/4,5/8,etc.
  I doubt the thing was hit by lightning or it probably wouldn't be
there.

WRONG! You only get 3 DB MAX when stacking,you don't get to add the gain
from the 2 antennas..too bad
Example 15 DB beam + another 15 DB beam nets you 18DB.
Yes I run 2 15.2 DBI beams,not on 11,I wish!

Radials should raise the Q of the antenna which will reduce bandwidth.

> #3 lowers angle of radiation

Nope. The takeoff angle of a vertical antenna is determined by ground conditions extending far beyond the length of the radials.

> #4 effectively reduces interference to other services
> in the local area or near field

Huh?

> #5 increases the gain of the array

That's possible, however, that is done by increasing the Q of the antenna hence better efficiency.

1-Toll free did not write the quoted text in your message. Dwight Stewart is
guilty.

2-You posted you talked with South Africa on 1 watt.

3-I have also spoken with Australia on SSB. If they had a couple watts in China,
we might hear them, but they are very limited in power output. (their gov't
doesn't
want them to be heard!)

12 volt gel cell batteries for sale. Used but all load tested good. 30 day guarantee !!! Removed from burglar/fire alarm systems and replaced every 3-5 years with new ones as preventative maintenance for our customers. I have sold hundreds of these to the QRP boys on the QRP-L. I will stand behind every one sold 100% ! Prices listed INCLUDE shipping via UPS to your door.

12 volt 4AH --- $10
12 volt 6AH --- $12
12 volt 7AH --- $13

I have only a few 4's and 6's and about 36 of the 7's. Brands are mixed: Yuasa, Interstate, Portalac, Radionics, Power Patrol, MK Battery, Batteries Plus, Power Sonic and a couple of other brands. I do not and will not sell Panasonic brand as they have proven themselves to be total junk. Please email me with quantity desired and your zip code.

Welcome to the discussion, Martin. I understand what you are trying to say, but I must point out that all of this has been covered over and over in this newsgroup. We have discussed the legal establishment of the FCC. We have discussed the ITU.

We have discussed the reasons behind the rules. We have discussed the negative effects of illegal equipment. We have discussed the negative effects to other radio services. We have discussed the negative effects to other CB operators. We have even discussed the negative effect all this has on the image of CB radio. And we have discussed alternatives to illegal operation.

And I should also point out that this is not just the position of the ham operators in this newsgroup (by the way, we are also active CB'ers - not just ham operators). Many non-ham Cb'ers have also argued with Jeff about these very same issues. Jeff has just centered on the few ham operators here in an effort to split his opposition and thereby strengthen his side of the discussion.

You are entering this debate after weeks of discussion back and forth. In the beginning, the debate was as polite as you advocate. However, after weeks of mudslinging (on both sides), the debate has become somewhat heated.

It is at this point that Jeff decided to invite you into the discussion. I'm sure Jeff has described himself as the poor victum of trolling ham operators out to pick on him (he has done this in the newsgroup many times). However, if you read over some of his past messages, you will quickly see that he has given as much as he has got.

You state that we should point out the violations privately and respectfully. However, when public statements are made, the only way to address those statements is to use the same public forum. And respect has to go both ways.

So Martin, the only thing you are right about is the futility of continued debate with Jeff. But, I must also point out that we are not just addressing Jeff in this public discussion - we are also addressing the countless people who may be reading Jeff's messages. Perhaps we cannot change Jeff's mind, but we might present an argument that will convince others.

However, I'm more than willing to drop the discussion if Jeff is. In fact, I've offered to do so many times. But, if he wants to continue his assault on the ham radio operators in this newsgroup (such as he did when HE USED YOU to try to support his claim that we have an ""RF police, holier than thou, "because I said so" attitude."), then I feel obligated to respond.

******

> #1 provides a better match

That's possible

> #2 provides additional bandwidth

Radials should raise the Q of the antenna which will reduce bandwidth. Wrong! adding the gpk-1 radial kit improves bandwidth........do the tests!

> #3 lowers angle of radiation

Nope. The takeoff angle of a vertical antenna is determined by ground conditions extending far beyond the length of the radials. Wrong! The radials lower the angle of radiation regardless of the height above ground, however, the lowered angle can be enhanced by using a good ground system as well as making sure that the feedpoint is at least one wavelength or any multiple of whole wavelengths above ground

> #4 effectively reduces interference to other services
> in the local area or near field

Huh? Yeah, you know! like television and telephone interference!

> #5 increases the gain of the array

That's possible, however, that is done by increasing the Q of the antenna hence better efficiency. Wrong! See #2

Sorry Tracy,

We're not talking about beam antenna, we're talking vertically polarized colinear arrays.
You of all people should know better than this! Just go look at the colinear designs that they use for vhf and uhf stations and repeaters....
There are vhf and uhf vertical colinear arrays in the 9 - 15 db gain region and beyond. The same type of design applies to the antron 99. If you want to compare apples, well then let's compare apples and leave the rest of the fruit out of discussion!

Jack

http://www.angelfire.com/az/firecommunications/

The addition of the gpk-1 changes the A-99 from a 1/2 wave over a 1/4 wave to a 1/2 wave over a 1/2 wave........the physically shortened radials are loaded 1/4 wave elements. The gain is still somewhere between 7 and 9 db .

I have a 48 Rohn free standing, just outside Wilmington if your interested. Email me if you want more details....

thanks
David

No one way would be a 6 port combiner and the other a 3 port combiner. the 6 port would be used when there are 2 pill stages where each 2 pill output imp is 50 ohms then they are all combined with the 6 port and a LC network, or the 3 port com would be used when 3 - 4 pill stage outputs are combined into a 3 port then into the LC network. Then there is the old days when 5 turns were used and 6 pills were fed into one 3 port and the other 6 went into another 3 port combiners, which then was combined and tuned at this point.

Hi,

Does anyone have the mic pinout for the Eagle sidewinder?

I really hate the original mike and intend on wiring one of my own.
TIA

T.W.

Jack what have you been smoking, 9.9 dbi gain. Anyhow after a certain heigth
above ground the radilas make very very little differance, the associated
ground losses are not there after you go up more than 36 ft for 11 meters.

Get out your ARRL books you will see 85 ft in the air for an 11 meter
vertical antenna the ground radials will probably not show any differance.

Jack Thurston <fire228@cybertrails.com> wrote in message

>   (Another myth destroyed)

>
> You saw it, you looked at it, it was about 18 feet long, and right off the bat you decided, "It's a half wave antenna".......Well, you're wrong again!
>
> The Antron 99 is a loaded 1/2 wave over a loaded 1/4 wave, variable mutual transductance tuned vertical antenna! "Anyone who had read the advertising would know this"!
>
> The term colinear simply means "in a straight line". Any antenna using 2 or more discrete elements stacked one above the other, is a colinear array.
> To be exact, it is a 2 element stacked colinear array for the 10 and 11 meter bands! Put it together and place the feedpoint at 37 feet above the ground, (which is approximately one wavelength at 27 mhz) and don't forget to connect the other end of the feed to the "base". Pick up the ground plane kit for it later on as this is a worthwhile addition! Besides decoupling the antenna from the feedline and optimizing the input impedance the ground plane kit will also help further reduce rf interference and TVI in the near field of the antenna.
>
> The Antron 99 is a half wave over a quarter wave variable mutual transconductance tuned antenna. When you add the ground plane kit it becomes a true colinear antenna. During the last several months, with the exception of days of high solar x-ray activity, I have maintained semi-consistent contact with several stations in Australia using an HR-2510 running 40 watts on ssb with an A-99 with a feedpoint height of approximately 74 feet. (92 feet to the tip)
> A simple 1/2 wave colinear array consists of two halfwave antennas, one stacked above the other. When you add the ground plane kit to the basic 99, this is what you end up with.
> Many have disputed this, and usually because:

My DX-440 SW receiver has an IF filter with narrow and wide modes.
On narrow it filters out everything beyond 3 KHz. If I tune an AM
station and tune away 3 KHz, it sounds like bleedover. When I put
it back on wide mode, I can hear the high frequencies better because
the part of the signal with the higher frequencies is now is the
receiver's passband.

Dwight,
The big question that the news group usually keeps mulling over is the legality of FCC rules and their enforcement, Jeff and myself have discussed the following:

1. Right to Inspect: Yes the rules (CFR 47 part 95 and 97 state you MUST allow inspection but the law is only directory, not mandatory. That means, if you do not allow inspection, the 2 recourses allowed the FCC are:
   A. Monetary Fine (NAL for lack of candor)
   B. Warrant in which Mr. FCC brings along some of his Federal and State LEO friends (aka 3 letter agencies).
2. What is the ITU, what about the code requirement and why does each and every country of the world subscribe to the ITU.
3. Linears are they legal (read Part 95 and 97), their use and enforcement.

The major thing is to learn the why fore and becauses inorder to explain the reasons behind any rule. People don't want "I told you so" answers, research is the key to presenting persasive debate so read the rules, study the laws and their application and always ask questions. As newbie to newsgroups, I want to emphazize you do not want to be relegated to TROLL status and something else which needs to be said, those persons who wish to do as they please must suffer their own consequences, I can not make myself miserable over those who wish to operate linears, freeband, out of band etc. The proper method is to point out, PRIVATELY and RESPSCTFULLY, the violation and if the person doesn't see the error of his or her ways, then you have done all that is in YOUR POWER to do, they must learn to suffer their consequences.

The main conerstone to radio is polite operations, we want people to be curious about Amateur Radio and CB, not revolted by it.

Mike,

If you have a radio with ssb in it,
then you already have a radio like this.

Jack

Newsgroups: rec.radio.cb,rec.radio.amateur.antenna

Hi there,

Recently I attached an old (& cheap) CB base station to the antenna on top of the tower at our cabin (we inherited tower & antenna from previous owner). The tower is about 85' high, and the antenna is about

13-14' high (??) fibreglass pole, with 4 horizontal radials (each about same size as the antenna) at the base of it (up at top of tower). The antenna did work somewhat, I could talk to my mobile CB and back for a distance of 2-3 miles, with varying degrees of clarity. But sometimes talk was barely understandable at 2 miles. The terrain is flat & wooded, cabin is on a slight hill on lakeside.

The antenna has been up since the mid 70's, and I know for a fact that it has been hit by lightning several times. When checked with a multimeter, there is no resistance between the center conductor of the

```
coax and the coax shielding (I was replacing the connector on the
bottom). So, (here is where I start guessing), I think that the
radials should be connected to the shield of the coax (true?) and the
antenna should be connected to the core of the coax, and that there
should be some resistance between them (?). Does the lack of
resistance mean that something has been cooked & shorted up top
because of a lightning strike? Do you think the performance would
improve dramatically by replacing the antenna? I am thinking that the
antenna is probably cooked and that maybe when I attach it to a CB, it
sort of works, but might be having pathetic performance limiting my
range (despite the fact that this tower is TALL). Of course the old,
cheapo base station might not be helping either, but I can't really
tell that until I get another unit to test (I can use another mobile
on base antenna and see if things are any better).

Is there a way to determine whether a CB base antenna is in good
working order, including the radials? (especially without having to
take it down)

Thanks in advance for your $.02

Brent

Wow, antenna, did anyone ever try one of those back of the set antenna?  I had
a big stick for my forst antenns, but when I wanted to move my radio to my bed
at night, I would put a back of the set I got from radio shack, and it worked
great for local people.  Then I had a 3 element beam, but a storm took it down,
so I finally ended up with a 5/8 th wave which was great!...  I mss my CB days.
 Haven't been on for a while myself, but this newsgroup has me thinking about a
SSB mobile, but yes I am a h__ and talk on there too, but who says you can't go
back from time to time?

Hiya,

This is a followup on my long post about testing a cb base antenna.
If/when I replace with another (for example an Antron 99) should I
bother getting the kit for adding radials up there? The guy at the
shop I spoke to thought there shouldn't be much need for them on an
85' tower. What is their advantage? I'm interested in the best range
for local communication with mobiles and HT's, not DXing if that makes
any difference.

thanks,

Brent

I have a like new, 3 week old, 3 element beam antenna, the M-103C by Maco, for sale. I'm selling this due to the fact that I cannot install this antenna at my present location. Thought I could, for many reasons cannot. I also cannot return it from where I purchased it due to the fact that the box was opened. The antenna has NEVER been assembled and has all of the original UNOPENED hardware. It also of course has the installation manual. This antenna sells for around $100 new plus shipping.

For more info please click here:
http://www.majestic-comm.com/maco/products/antenna/m103c.htm

I'm selling it for $85 which includes shipping via UPS oversize.

A ham, huh? Let me add my 2 cents. I live and play in Tampa Bay. I have over a hundred countries myself(ALL contacts made between 25 and 27.995) with the cards to prove it. So I know 112 countries is not only possible, it is probable. I don't have a beam, only a Maco 5/8 GP about 46 foot in the air. The most power I have run is 100 watts(which is VERY rare, only to get a QSO card from a rare or exotic locale) and most were made with 12 whiskey out on the side. I do know that the amount of water that surrounds my state plays a part, but I am a driver who routinely talks DX from my mobile rig out of state and country when I am on the road. Get with a free-bander who knows his stuff. Sounds like the guy with 112 countries can teach you a thing or two about propagation!!!

The radials on a ground plane antenna are needed to provide a counterpoise for the driven element. Since the A99 is nothing more than a 1/2 wave vertical dipole, the counterpoise is already inside the antenna. The radial kit they sell for it is a way to make a quick buck from the CB crowd.

I would like an honest opinion on the center loaded trucker antenna from K40. Is it as good a performer as the base loaded K40 with the same low SWR characteristics? And yes, I've tried the Wilson 2000 and didn't like it.

Dan,

Careful Dan, Antron claimed the antenna is co-linear -
a 1/2 wave over a 1/4 wave antenna.....so, in this case,
are radials needed? They correctly slant down at 45 degrees -
to bring the radiation resistance up from 36 to 50 Ohms
like the typical ground plane antenna.....but, why are they only
6 feet long? One must wonder......

The B.O.B.

Tim, you said countries. You said that in three or four messages (and
you gave specific examples). You did not change your claim to dxcc
countries until another person gave you that idea.

Anyone can read back over the messages to see what was said. They can
form their own opinions afer that.

```

******

The Antron 99 is not a half wave antenna!

(Another myth destroyed)

You saw it, you looked at it, it was about 18 feet long, and right off the bat you decided, "It's a half wave antenna".......Well, you're wrong again!

The Antron 99 is a loaded 1/2 wave over a loaded 1/4 wave, variable mutual transductance tuned vertical antenna! "Anyone who had read the advertising would know this"!

The term colinear simply means "in a straight line". Any antenna using 2 or more discrete elements stacked one above the other, is a colinear array.
To be exact, it is a 2 element stacked colinear array for the 10 and 11 meter bands! Put it together and place the feedpoint at 37 feet above the ground, (which is approximately one wavelength at 27 mhz) and don't forget to connect the other end of the feed to the "base". Pick up the ground plane kit for it later on as this is a worthwhile addition! Besides decoupling the antenna from the feedline and optimizing the input impedance the ground plane kit will also help further reduce rf interference and TVI in the near field of the antenna.

The Antron 99 is a half wave over a quarter wave variable mutual transconductance tuned antenna. When you add the ground plane kit it becomes a true colinear antenna. During the last several months, with the exception of days of high solar x-ray activity, I have maintained semi-consistent contact with several stations in Australia using an HR-2510 running 40 watts on ssb with an A-99 with a feedpoint height of approximately 74 feet. (92 feet to the tip)
A simple 1/2 wave colinear array consists of two halfwave antennas, one stacked above the other. When you add the ground plane kit to the basic

99,
this is what you end up with.
  Many have disputed this, and usually because:

#1 They see it is 18 feet long and assume it is
a halfwave antenna based on physical size.

#2 They have simply never read the advertising.

#3 They have never seen the inside of the A-99.

  And you know what? That advertised figure of 9.9dbi. (i=isotropic
source
/very few people know what this is) isn't that far off. Subtract a
couple
tenths of a db. from each of two loaded halfwave antennas then add 3db.
for
stacking and you'll see that this figure is fairly accurate.

```
  Example  top loaded halfwave    = 3.0 db.
          *bottom loaded halfwave = 3.0 db.
           gain from stacking     = 3.0 db.

           Total gain             = 9.0 db.

  * includes ground plane kit
```

No, your lingo did not confuse me, Tim. You made a specific claim
(and gave examples of the countries that you contacted). You did not
say a thing about dxcc countries until three of four messages later,
after another person brought it up.

once again for radio purposes 1 dxcc = 1 country. are we not talking about
radio contacts here? ive been around a long time i dont need anybody to give me
ideas.

Actually, not really. While you can have a station on USB, while another
runs on LSB, all is fine until the signals get REAL strong, then there
is bleedover, just like we have now. As long as you aren't over s9+,
thee won't be a problem, but if you are in town with locals that run +20

over, you'd be wise to avoid the adjacent sideband.

Of course, with a slightly narrower filter (About 1.9 Khz), much of that interference could be minimized, at the expense of audio fidelity.

The entire sales pitch with the A-99 and radials, is a huge hoax!! The
antenna was designed in the first place to operate without radials!! It

isn't a groundplane!! It will do fine as is!!

Brent and the ng,

The bottom half of the A-99 is a quarter wave
element. Quarter wave antennas require a radial
system for all the reasons previously mentioned!

With the addition of the radial system the A-99 becomes a true 1/2 wave colinear antenna.

  Nothing any of you have to say will change that!

        Jack

  Well Dave, maybe that explains all the horrible rules on the business bands. Or the radio regulations placed on commercial aricraft. Those guys at the FCC are a bunch of ham operators and are out to get everyone else. ;-)

  You know, considering the popularity of CB over the years, it would not be too much of a stretch to image that at least several of the FCC heads (past and present) were once CB users. In fact, it would be rather surprising if they weren't.

  Anyway, I have not seen any negative attitudes towards CB by the

officials at the FCC. I have seen a demand that the rules be obeyed, and I have seen enforcement actions taken against those who did not obey the rules. But, I have not seen CB treated any differently than the other radio services.

Hi Jack,

Relax...breath in, breath out.

I never said it was a 1/2 wave antenna.

I am kinda tired of arguing things on here, you know?

However, you screwed up your gain numbers totally, though.

Thankfully, Solarcon NO LONGER claims that gain figure - they
dropped in down to 3 dbi --- which is the absolute truth.

I am sure you sell these miracle antennas and tell all
your customers it has more gain than a 4 element
yagi!!!! Amazing!!!! Come on Jack, do you honestly
believe this has more gain than a 4 element beam?
More than a 3 or even a 2 element yagi?

A *loaded* 1/2 wave vertical antenna has about
2 dbi worth of gain, a loaded 1/4 wave antenna has
practically no gain ~ 1 dbi.

True, stacking increasing gain by 3db, but Jack, the
pattern of these two antennas are so tightly coupled
(they are too close to one another) that you see
no increase in gain from stacking. You
rely on the spec sheet for all your knowledge?

Why do you say 3db worth of gain for the 1/2 wave, add another 3 db for
a ground plane antenna, then add 3 db for stacking?
Thats not even how you calculate additional gain from stacking!

Say both antennas somehow had 3 db of gain, stacking them
only puts your gain up to 6 db (NOT 9, 3db + 3db +3 db)

But this is neither here, nor there, the A99 has the same
gain as a 1/2 wave vertical - but has the advantage
of wider bandwidth.

The radials are a gimmick - why do you think they are 6 feet
long? It is cheaper to just re-use the top sections rather than
endure the cost of making another fiberglass piece.

For the sake of more business, argue this until you fall over
dead.

BoB.

Brent,

Well, there you go! I can tell you this,
regardless of all the tech "headbumping"...
I maintain 'round the clock schedules
with stations in Flagstaff, about 100 miles
west of here and a fairly regular schedule
with 2 stations in Australia running 40 w.
lsb. If this is what you're looking for,
then the ground plane kit would be a worthy
addition, again for the reasons listed below:

#1 provides a better match
#2 provides additional bandwidth
#3 lowers angle of radiation
#4 effectively reduces interference to other services

in the local area or near field
#5 increases the gain of the array

If you have any further questions, email me at:

fire228@cybertrails.com

Radio Shack does not carry the Crossbow anymore. In fact, they currently carry the Solacon A99 in their catalog (the Antron 99). Item number 21-869.

Check out the new ARRL catalog. They want 289.00 for a USED Washington.
The retail down here in Dixie on a Uniden Washington is 279.00 NEW!!
Goes to show some people will pay anything.

Oh, jeff, there is an appeal route from the civil forfieture rules and
to even the Federal Court system under civil rules.

> > it's a word game that they play that circumvents your civil rights.

The evidence you stated would be acceptable due to expert witness rules
in the Federal Court System.   The FBI uses the samre technology to
track "bugged" items and they even use "amateur" Fox-hound equipment
which the amateurs developed. (See dopsys.com and joe moell's (k0ov)
website which I think is http://members.aol.com/homingin)

so the take it into the

GOOD THING, it would hate to see the FCC turned into an Bureau ATF with
full metaljacket type powers. The FCC was designed to be a regulatory
agency in 1934 (FRC, Federal Radio Commission before that was a Dept of
Commerce Organization with US Navy and FBI doing Radio Investigation),
not a Law Enforcement Agency.
>

The 26-27mhz region is lused in several Latin American Countries as a
"Business band" with high power limits, FM, Amps etc., the licensing
authorities of most South and Central American Countries are very strict
about their licensing and deal harshly with violators, on the other
hand, high power licensing is the Norm there.

Can someone please answer this for me. I set my base station back up again
with little room to work. Will I run into any problems if my radio and amp
are to close to my power supply? I don't mean an electrical problem I am
referring to an RF problem. I have keyed it up and have not detected

anything so far. Other then coming though every channel on my TV's ...lol. I would really like some help on this matter.

Thank you,

Gunsmoke <<AKA>> Mr.. Double post

So then,

The two port based amplifiers (2, 4, 8, 16, 32) don't use the same splitters and combiners the odd amps (6, 12, 24, 48) use then, do they.

Seems to me that is what I said in the first place.

I am interested in getting either the Maco or the Imax. I was wondering what everyone experienced with these two models. I am looking for a good rugged antenna to replace my A99 which is WAY too dirty for my area because of the closeness of my neighbors. Also, I am open to other suggestions on vertical antennas that won't take out the surrounding houses' tvs, stereos and phones.

Thanks in advance and 73s

Mudpuppy

These steps should be absolutely taken before using "common" found mods for the Cobra 148 GTL.

Remove C35 and C16. Short pins 3-(red wire) and 5 (yellow wire) of the connector on the channel selector PCB.

I have found by study that this is the most direct way (while best sounding) of smashing ST more less.

Hank

Do they seem to be the same quality? Do they take to tuning the same? RX or TX any different?

******

I hear literally several hundred stations every day on 38 lsb who have absolutely no problem talking to anyone on the frequency!

This usually occurs because of inadvertant "twisting and twiddling" with the ssb tx and rcve offsets, usually unknowingly by well meaning technicians who are unaware that their "playing around" can create some frustrating problems. Very few shops are equipped to handle adjustments of this nature!

After you and another operator have "chased each other around the dial" a few times, you know what you have to do!

Jack

>> Keep in mind that a 3CX15000B7 tube was built for efficiency and low
>operating
>> cost.
>
>They where also built for a 15Kw transmitter... Nothing more.

>Look at the specs.
>
>Do the math.

I should have qualified my answer a little better- WMMR in Philadelphia runs a par of B7's in Class C FM service. In 24 hour a day service it is a very effiecient tube to run in comparison to a directly heated cathode tube (the B7)

>
>They can't hold their own with the "other" triodes of equal dissipation.

I agree on output power- but efficency and low drive power was the design parameter- not raw power output.
Thats why they are used in broadcast service- electric does cost money when the xmitter is always keyed. I dont think we worry about the electric meter too much for the short period of time we transmit. It also would be a good tube for mobile use. 15 amps of filament current is alot less than 100. If raw power output was the only objective i'd run (2) B7's instead of (1) A7. You would get the same output with less filament current, less drive and actually have a little more room for error. Before you say it... I agree that (2) tubes would be costly.

> They are used in 30KW FM transmitters everyday of the week 24hrs/7 days a
>> week
>
>
>Name one commercial (Harris, Gates, Collins, Henry) 30Kw transmitter using
>the 3CX15000B7 tube?

WMMR runs an Omnitronix Broadcast C30K, and Scientific radio also made a 15KW SSB amp for military use (not broadcast) that had a solid state driver driving a 3by15B7. They also made a 5KW using the 3CX5000B7. I dont know the model #'s of the SR stuff.

Some of the other tubes of 15Kw dissipation will do it, but the B7 tube is only
>going to give you 15Kw output! At least, operated within ratings!

When do you CB guys ever run anything within their ratings?!!!!
:)

>That, and the grid doesn't have the dissipation necessary to get the drive
>level up high enough.
>
>And, the cathode doesn't have enough emission capability to do 30 grand!

Actually the close proximity of the cathode to the control grid helps this, it wont do 30 grand, but it also only requires one seventh the filament current (directly related to cathode emission) to do half the power. Not a bad trade off and very helpful in some applications. (Efficiency again)

>Their is a reason that the other 15Kw tubes have 100A on the filament!

Yup!

>. A 3CX15000A7, or any other directly heated cathode tube requires very
>> much drive power and mega filament current. The A7 requires 100 amps of
>> filament current where the B7 only requires 15 amps.
>
>
>Because at 14.?? Kilowatts of output (which is what it is rated at), the fil
>/ cathode doesn't need to give off that many electrons.

Equal Drive power, Plate Voltage and Plate Current, Both tubes will do about the same out (at 15KW), but the B7 will still do it more efficiently. No need to dissapate a KW of filament current, especially if you go mobile.

> The A7 also requires 1KW
>> or more of drive power for full output where the B7 only requires 400
>watts.
>
>It takes half the power input because it is outputting half the power!

Not exactly half- 40% which is still more efficent.
>
>
>> This saves on operating cost and the hardware required to drive the amp.
>

>owned by
>> CPI) ceramics are a good bet to go with and will do big CB power. You
>might use
>> cost and availablity for your overall determining factor.

I think that paragraph sums it all up- You should make your decision depending upon cost, availability, and required power output. B7's are evrywhere and can be had for Cheap but run whatever you can get! Another cost factor should be factored into reliabilty. I know this dude running (8) 3-500Z's and getting a rediculous amount of power out of them but he blows them every 3 months. He could just run one 3CX3000, do more power, and its still cheaper in the long run.
Too many guys out here are penny wise/dollar foolish. A good expensive tube can be much less expensive in the long run than a bunch of cheap tubes.

>the BIGGEST reason people are running the 3CX3K tubes is because of their
>availability on the surplus market.
>

And they are cheap as hell, just bought a brand new CPI 3CX3000 for $729

>If the CB amp craze continues, keep looking and you will find the 3CX2500
>tube being sold. It is starting to hit the surplus (medical pulls) market,
>and has the same dissipation on the plate, but a somewhat lighter grid.

I'd rather have the 3by3 in the long run- goes back to the penny-wise/dollar foolish theory. Spend a couple more bucks for the reliabiltiy.

> I like the 3CX3000

>
>I, among many, never got over it, and we shy away from the 8877 tube.
>

Its actually a problem with any ceramic that encounters a parasitic, but the
8877 was especially sensitive to it because of the close proximity of the grid
and cathode. (one of the main reasons it is such an effiecient tube)
>
> The easiest way to

>
>Sounds like you like Richy Measures!

I dont always agree with Rich- he is a little to opinionated but he is right
about parasitics! Ask an Eimac engineer what makes most of these tubes fail.

"Jeff,
the interconnection between countries on ANY type of telcommunications is overseen by the ITU, The ITU was founded in 1859 to standardize telegraph connections between European countries as to allow for the rapid passing of traffic or messages. With invention of Telephone and radio, the ITU assumed duties in regards with the Cairo Conferance of 1906 which set up an international standards committee which came up with the phonetic allocation scheme (K,N, and W along with AA to AK for the US, G and M for the UK, D for Germany, I for Italy and so on). The ITU regulates the international usage of telephone, telegraph, data, radio etc. It became a dept of the UN when the UN was founded in 1945 and before that it was under the League of Nations in Geneva, Switzerland. The ITU is called a specialized dept of the UN and the Telephone money is a great source of revenue for some small countries. Radio is included since international conferences have delgated radio to the ITU since 1906. The ITU has set up the international allocations in regard to Marine, Business, military, amateur, radio telephone, medical devices and other radio services. The standard ITU agreement cover any type of electronic communication and is many pages long with technical BS from DC to Light. Every country on this planet has signed the ITU agreement since international interconnection depends on ITU standarization. Some countries are not close followers of ITU and some have no central functioning governments but those that do (about 99 percent of the world) want that telephone money."

"The FCC administers the Civilian Portion of this program in the US and the NTIA (see www.ntia.gov) allocates usuage in the US for government and military usage on the Federal Level. (Some of freeband is NTIA stuff!). The FCC and FBI have concurrant jurisdiction with NTIA stuff. SCARY..."

"On the International level, ITU allocations differ from region to region, most of the Western Hemishpere is in Region 2 (Ham Test Question). CB radio in North America (Canada and the US) is 40 channel

AM type emission (called A3 in ITU parlance) with a limitation imposed by only the countries themselves. In Central and South America, These so called export radios can be used on different channels since each country can set their own standards. (Hint: 26 to 28 Mhz around the world has been allocated to individual countries usuage, so each country may set up its own type of radio service as it wants). The high power stations from the south are mainly business types since VHF and UHF radio are so expensive. Costa Rica allows usuage of up to 100 watts ERP on Radio Personal which is their name for CB. Belize allows Business usage radio upto 35 watts on CB with extra channels available. This will shed some light on why CB is low priority with the FCC. The only beef I could see with this arrangement and the ITU is that the ITU agreement states that the general usuage band we call CB can not be used for international contacts. Unless some country complains, the FCC will only pay minimal duty to the CB Band, however, some countries have been complaining about our CB and Ham Bands which I think has sparked the current round of enforcement. CUBA has complained about interference to its ham nets and repeater systems (We do pay some attention to Cuba since most Carribean telephone and microwave links pass by and through CUBA by international agreement from Florida)."

"I would recommend looking at the FCC website, searching the UN and ITU with search engines, The ARRL has a portion (chapter) of the rulebook outlining the ITU and relationships."

"The main reason I got an Amateur Radio License was to communicate with home and almost every country honors an Amateur license without fail, however, there may be some bookwork involved but recip licenses can be obtained and it clears the path for you to carry radio gear in some countries which have a different view about 2 way radio."

"In Columbia, CB radios are illegal without licensure and possession of unauthorized radios will put you on a collision course with the local gendarmes. Had a friend who was a radio hobbist who worked in Columbia on a Drilling Rig in the Jungle. He brought his scanner and 2950 10/11meter radio and got through customs (Oil drilling equipment) but on the rig, his radio skip chasing got quick notice form the Columbian Authorities (HOW? I really don't know, but I suspect drug/guerilla fighting). The legal hassle without a license cost him his job and expulsion from the country. He was asked, he told them he was a Ham and they asked for a licnese and found he wasn't licensed for Ham in the US, he was told he would have been eligible for a reciprical license but illegal operations were another thing. A $100,000 a year job lost."

"73 de Martin N5PZJ"

to repeat martins text in it's entirety will keep me from being accused of taking words out of context.

NOTE TO MARTIN: please correct me if i misinterpret anything here.

" These so
called export radios can be used on different channels since each

country can set their own standards."

if we signed the ITU treaties, are we not entitled to the same rights under these treaties? with this, i should rest my case but i won't. there is much more.

"CB radio in North America (Canada and the US) is 40 channel
AM type emission (called A3 in ITU parlance) with a limitation imposed
by only the countries themselves."

so why is this the best kept secret in the U.S.A.?
either there are a whole bunch of hams, (RF police), who don't do anything but the ARRL lock step on this subject, or they are greatly uninformed, (as i was), on the political history of RF communications.
the "because i said so" bullshit never did cut it with me and now Martin has just ripped the edges from your RF swords with some rocks of truth.

"(Hint: 26 to 28 Mhz around the
world has been allocated to individual countries usuage, so each country
may set up its own type of radio service as it wants)."

so why are we so far behind the 3rd world on this???
because "I SAID SO" said so? more bullshit.

" Costa Rica allows usuage of up to 100 watts ERP
on Radio Personal which is their name for CB."

"I SAID SO" strikes again.

"The only
beef I could see with this arrangement and the ITU is that the ITU agreement
states that the general usuage band we call CB can not be used for
international contacts."

i don't know when this was written into the agreement but, in this day of comparitive world peace, it doesn't seem to be needed anymore. there is always going to be some trouble in the world and if terrorists need long distance comms, they can always go to illegal use of high freq, short wave or the so-called "numbers" station set-ups or even something as simple as a telephone.
this rule is no longer needed, nesessary or wanted by the majority of the people that it affects the most. the cb'er. if these rules were to change, they would apply to hams and cb'ers alike so the hams would be welcome to increase their power / channel capabilities if they don't already have them. many do but the ones that do, won't admit it in public and the ones who don't, deny that any of the others do.
the only real, major opposition to any rule changes comes from the RF police types who appear to hold on to their licensed power / bandwidth privledges with great jealousy as they act like we should have to run the same gauntlet that they had to in order to get useful HF communications.
their effort is laudable but not nesessary for an average family when one partner has the electronic appitude to pass the test and the other and / or the children don't.
if the FCC would exercize their LATITUDE in this matter as mentioned above,

there COULD be a license similar to the old cb license for a medium high powered "free band" that anyone in any family could get and use. my wife hasn't got a clue about electronics and is not interested in learning but knows enough to turn on a radio, change a channel and key a microphone.
for reliable communications between home and my job, for us, would require somewhat more than 4 watts am or even 12 watts pep. 100 watts pep would be a start in my case but i couldn't see a need for more than 300 watts max for this band.
i've talked all over the world from my mobile on 200 watts pep so it's not that big of a deal for 300 watts. one should be able to go anywhere with that. and if the band isn't open, more power won't make a difference anyway.

"Unless some country complains, the FCC will
only pay minimal duty to the CB Band, "

here's the key!!! as long as there are people in charge of the FCC who are biased toward the ham communities' position, there will be no fair hearing for cb'ers.

"CUBA has complained about interference to its ham nets and repeater systems
(We do pay some attention to Cuba
since most Carribean telephone and microwave links pass by and through
CUBA by international agreement from Florida)."

this is a ham frequency problem. not a free band one. can't blame us this time.

"some countries have been
complaining about our CB and Ham Bands which I think has sparked the
current round of enforcement."

this is something that could be worked out with an enforced, LICENSED band with whatever adjustments to frequency and power allocations needed similar to the 5 skips within the first 23 channels of cb for r/c freqs.

to all of you RF police people out there,
if your parents would have slapped you down with a, "because i said so", and no other explaination every time you asked the question "WHY", you'd get pissed at them in a hurry.
this is the way that we've been treated here on this news group.
and then, to find out that all of the RF police either were mis-informed, too lazy to actually do some good by spelling out the situation as Martin has here, or lying / hiding the truth because it DOESN'T support your position has just un-plugged the last piece of life support afforded to your credibility.

now why don't we start over with some HONEST dialog and knock off the "BECAUSE I TOLD YOU SO" and the "BECAUSE THAT'S THE LAW" bullshit as well as the mis / dis-information that has been splattering our screans here for the last 3 months.
laws are laws and RULES are RULES.
as has been the history of the United States for more than 200 years, if certain laws and rules wern't changed in our history, we would be singing God save the queen or, if we didn't change our laws about being neutral during the 2nd war, we would be singing hail the furor, praise the emperor, (not the

radio), or be VERY alone in a world of teriney. each were made to be changed when they have been found, BY THE PEOPLE, to be out dated, out moded or unfair. these rules, by the changing face of the present LEGAL aspects of cb alone with linears and out-band issues aside, and by the shear numbers of cb's in use today, are very out moded. cb will NEVER be the same as it was in the "good old days". if everyone were to junk-box their linears at mid-night tonight, in most metropolitian areas, comms of more than 1 or 2 miles would still be impossible with either the number of cb's on the air or the proliferation of high rise buildings that didn't exist in the 50's when cb was born. under these conditions today, there IS a need for either higher power or more channels.

>   Okay Jeff, I read all that Martin has said. How does any of that
>support anything that you have said in this newsgroup? And how does any
>of it contradict anything that we have said in this newsgroup?
>

if you have any questions left, re-read all of the above.

>And, while you're at it, perhaps you should also tell us why Martin's
>opinions (the opinions that you say supports what you have said) are
>more valid than any of the other opinions posted in this newsgroup.

Martin has cited references that are relevant to the questions asked.
he hasen't only quoted from the holy book of "I SAID SO" like the rest of the RF police department has.
the questions asked were NOT, "what are the rules?", which has been the only thing quoted.
the questions asked HAVE been, "why do these rules exist and why can't they be changed?" no one has given an authoritative answer in 3 months.
here. now we have answers WITH references and they don't happen to agree with the RF police position. here comes the halo again.
just because you don't agree with what appears to be the truth backed up by references, now you call into question the credibility of the messenger. take another last gasp, friend. you're failing fast.

> Perhaps you should invite Martin to this newsgroup to read some of the
>messages you have posted. I doubt he would be so friendly afterward.
>

i have, he is welcome to review my posts and draw his own conclusions as he is free to do so.
by the attack that you fired at him first thing in your response to my attempt to present FACTS in a neutral non-adversarial fashion, i think he can get an impression on which side started the war.

either way, like me or not, i want to thank Martin for his contribution and education, in a neutral manner, on this subject which can lay to rest a lot of mis-conceptions that have flown around here IF people will research said references and get out of denial as it only makes them look more foolish.

NOTE FOR MARTIN,
just so i don't get accused of hiding anything, i have been a strong supporter of power and the out-bands.
i have also been harsh and vulger in my reponses but, generally, in self defense of myself or others who have been attacked and clubbed by the RF police

here in the last 3 months.
if you can pull up my posts and the postings that i was responding to with them, i think you'll understand why i was the way i was.
if the RF police were to meet me / us eye to eye as you have here, they would have met with the same respect as you have from me.
it seems that they don't come here to "elmer" or educate but to try to push us down or bully us into getting a ham ticket because, "I SAID SO", said so.
ham licenses are great and i'm all for them for the people who want them. my only point is that ham is sometimes too much and cb is not enough for some people. frs can be out of the question sometimes too.
the rules do exist. can they be changed? if not, why not? if so, how? and what do we have to do to get a fair hearing from the FCC.
some will say," stop breaking the rules and they will listen".
if everyone stopped breaking the rules, they would say, "there's no need to change anything as the band has settled down.
the squeaky wheel gets the grease except in our case, they grease the hub and insert a new shaft.
this will not improve comms much as the surface of the earth and it's changes in the metro areas will not shrink shorter to accomidate anything and the number of "legal" radios will stay the same with all the associated pile-ups that happen on a daily basis.
i hope this has answered ALL of the questions that you have asked of me on this post.
if not, re-read the entire thing 9 more times and then feel free to e-mail or post your questions again.
this is your one and only "FREE COUPON" to go over this whole bowl of hash ONE MORE TIME. coupon expires 11/16/2000.
get your stuff together, if nesessary, and ask away.
after that, i will answer you with a long string of HAHAHAHAHAHAHAHAHA's.
have a good night.
jeff
P.S.
you asked, so i hit the e-mail box.
it won't happen again unless you e-mail me again, personally as you've requested.
jeff

<fire228@cybertrails.com> wrote:

> You saw it, you looked at it, it was about 18 feet long, and right off the bat you decided, "It's a half wave antenna".......Well, you're wrong again!

18 feet IS a half wave. It IS a half wave antenna.

> The Antron 99 is a loaded 1/2 wave over a loaded 1/4 wave, variable mutual transductance tuned vertical antenna! "Anyone who had read the advertising would know this"!

Wow! Can you repeat that again with a straight face???

How do you make a loaded 1/2 wave and place that over a loaded 1/4 wave? And exactly what is all that "loading" supposed to do? It sounds like pure unvarnished CB hoo-doo jargon!

1.) Collinear antennas obtain gain by virtue of the physical separation of the current loops. If the antenna is 1/2 wavelength loaded over a 1/4 wl, as you claim, the MOST you can possibly do is move the current maxima's maybe ten feet apart.

Collinear gain would be very small indeed, unlikely to have much more FS than an "unfancy" 1/2 wl radiator.

2.) This loading, at the same, will decrease the ampere/feet of the radiation areas of the antenna while adding loading system losses.

Woops, there goes the collinear gain!

> The term colinear simply means "in a straight line". Any antenna using 2 or more discrete elements stacked one above the other, is a colinear array.

...and the gain depends on the physical spacing of current maximas, as well as the area of those maxima's.......

>To be exact, it is a 2 element stacked colinear array for the 10 and 11
>meter bands!

A collinear that doesn't occupy any spatial area. What a magic trick!

>   The Antron 99 is a half wave over a quarter wave variable mutual
>transconductance tuned antenna.

Supercalifrigerespealidosis, that word that I invent to impress the
girls the most'est!

>When you add the ground plane kit it
>becomes
>a true colinear antenna.

With no element spacing? As opposed to a false one?

>During the last several months, with the
>exception
>of days of high solar x-ray activity, I have maintained semi-consistent
>contact with several stations in Australia using an HR-2510 running 40

>on ssb with an A-99 with a feedpoint height of approximately 74 feet.
>(92 feet to the tip)

Wow, that's more impressive than Fractenna's runs! Imagine running 40
watts and working all the way to Australia on 11 meters during a
sunspot peak! I'm awestruck with the magnitude of such a difficult
accomplishment!

> A simple 1/2 wave colinear array consists of two halfwave antennas,
>one
>stacked above the other. When you add the ground plane kit to the basic
>99,
>this is what you end up with.

Does the groundplane hang straight down, to make it a truer than true
so'nuf collinear?

> Many have disputed this, and usually because:
>
>#1 They see it is 18 feet long and assume it is
>a halfwave antenna based on physical size.

Sounds like a half wave to me, unless Chip measured it fractally.

>#2 They have simply never read the advertising.

I know I trust advertising men.

>#3 They have never seen the inside of the A-99.

...and would they know what they were looking at, besides a bunch of
wyers and steff?

> And you know what? That advertised figure of 9.9dbi. (i=isotropic
>source
>/very few people know what this is) isn't that far off. Subtract a
>couple
>tenths of a db. from each of two loaded halfwave antennas then add 3db.
>for
>stacking and you'll see that this figure is fairly accurate.

Bull. Get your charts out and have a gander at collinears. 3 dB gain
requires the current lobes be separated 3/4 of a wavelength
physically. And that gain is gain over whatever a single element
does.

If you load the single element, the gain drops.

So if you stacked "your" antenna current centers 3/4 wl apart, the
gain would still be less than a true collinear with dipoles because
the individual elements are loaded.

Now, unless you've found a way to fold space... you'll have a tough
time seperating the current centers 3/4 wl in an antenna 1/2 wl long.

```
>  Example  top loaded halfwave    = 3.0 db.
>          *bottom loaded halfwave = 3.0 db.
>           gain from stacking     = 3.0 db.
>
>           Total gain             = 9.0 db.
```

Get real. What is that crap, new math?

```
>  * includes ground plane kit
>
>        Jack
```

Jack, seriously now....that stuff you came up with is all a bunch of
crap.

73 Tom

Man your kidding!! What a drag. Now Wilsons will be relagated to the
same quality as Radio Shack antennas. I guess K40 is happy...

If your interested in local then yes the ground plane kit will help.
It will help to radiate more of your power horizontal to the earth.
Less of your signal will go up toward the sky.

Turn off the java and javascript functions. Keeps your PC secure.
Stops those damn windows from popping up. I have 2 profiles in my
Netscape. One has java enabled for surfing known sites. This profile
has java disabled to prevent someone from bombing me with some HTML
crap!

:

:   And you know what? That advertised figure of 9.9dbi. (i=isotropic
: source
: /very few people know what this is) isn't that far off. Subtract a
: couple
: tenths of a db. from each of two loaded halfwave antennas then add 3db.
: for
: stacking and you'll see that this figure is fairly accurate.
:
:   Example top loaded halfwave   = 3.0 db.
:   *bottom loaded halfwave = 3.0 db.
:   gain from stacking   = 3.0 db.
:
:   Total gain   = 9.0 db.

You had better do some basic research on antenna stacking, Jack.

If you have two 3 dBi antennas, and you stack them at ideal spacing,
you gain 3 dB over the gain of ONE antenna - not the sum of the gains
of both.

So the gain for 2 stacked 3 dBi antennas is 6 dBi.

: >
: > Not according to the old timer hams that I've known. It was used a
: > lot for shooting DX because it has more frequent band openings that
: > most other bands.
:
: What?!? 11 meters is virtually identical to 10 meters in DX propagation.
: And that propagation is dependent on active sunspots to be usefull or
: frequent. Other ham bands, that are lower in frequency, have much more
: consistent and predictable DX conditions. When the sunspots are high,
: you can't beat the DX on 10/11 meters, but when it is low, the DX is not

: there at all. 20 meters has DX almost any time, as does 40 and 80
: meters.
:
: 11 meters also had interference from ISM devices that were also assigned
: to the band. This made the band less desirable than 10 meters.
:
: 11 meters was also an oddball in harmonic relation to the other bands.
: Look at the other ham bands 80 meters is twice 160, 40 is twice 80, 20
: twice 40, 15 is 3 times 40, 10 is twice 20. This makes antenna
: resonances easier to make for multi-band operation, as well as crystal
: frequency synthesis. 11 meters does not conform to any of these schemes,
: so special antennas or tuners had to be used, as well as special
: oscillators for frequency generation.

Yep. Contrary to what the other person posted - Hams had little or no objection about 11 meters being allocated to other uses. The reasons you state are the primary ones. The band was almost totally unused in the 50s by Hams.
:
: That's where you're wrong. Hams have to take a test to demonstrate that
: they understand what they are doing (even if the test is administered
: like a joke). Most CBers wouldn't know the difference between a class C
: and a class AB1 amp, unless their local "tech" tells them.

Neither do a good share of Hams these days - including the Techs. The worst thing that was ever done was deciding to publish the question pool and make it multiple choice. A person can get their Extra ticket, and not understand a bit about electronics - just have the ability to copy 20 wpm code.

: > According to the ham test
: > study book I have even the no-code tech class hams can run 1500 watts
: > on all bands they have rights to if such is needed to get clear comms.
:
: Not entirely true. 10 meter operation is limited to the novice power
: level of 200 watts.

A no-code Tech cannot operate on 10 meters. That requires a Tech plus license.

:
: Actually, not really. While you can have a station on USB, while another
: runs on LSB, all is fine until the signals get REAL strong, then there
: is bleedover, just like we have now. As long as you aren't over s9+,
: thee won't be a problem, but if you are in town with locals that run +20
: over, you'd be wise to avoid the adjacent sideband.
:
: Of course, with a slightly narrower filter (About 1.9 Khz), much of that
: interference could be minimized, at the expense of audio fidelity.

You don't need that narrow of a filter. The FCC is starting to mandate
about 6.5 kHz spacing between channels for some UHF FM operatiions. An

AM signal should not consume any more bandwith than an FM signal.

There should be a knob on the radio labeled RF Gain. There might even be a
switch labeled RF Attenuator. If it has neither, then I personally would
not consider it a Ham radio, unless it is something out of the 1940s or
earlier.

I ran an Antron-99 with a ground plane kit for about five years. It was on a 36ft. mast on top of my roof. Now I run an I-MAX 2000 only on a 10ft. mast up on the roof. My I-MAX is about 26ft. LOWER (not counting antenna length) than my Antron was. My I-MAX 2000 BLOWS AWAY my old Antron-99. But the antron handles high winds better. The Antron is 18ft. long, and the I-MAX is 24ft. long.

Yes, he does..i guess since +1 hour of the UK time, hehehe.
Its nice to see some site with some effort involved showing up now and then for CB stuff.
I think its time i updated my links pages so if anyone has any CB related sites you have found interesting, let me know!

Regards
Greg

Okay, this is the last time I'm going to comment on this, John. READ THE ORIGINAL MESSAGES FOR YOURSELF. Tim did not say dxcc countries. He specificially said countries. He did not change his claim to dxcc countries until several messages later when someone else brought that up.

Tim has come back now with a twisted version of his original claims, hoping that nobody will go back to see what he actually said in those earlier messages. I'm more than willing to stand by my original statements - it is Tim that is changing his claims.

However, I've had enough of this nonsense. If you want to believe that Tim has contacted 112 countries under the conditions he origionally stated, than more power to you. I've given my opinion on this subject (over and over) and do not plan on endlessly repeating myself.

Yep, I noticed that. It's a big improvement on the radios that they have carried in the past. Price is a little high on the Washington though. I've seen it for somewhat less at other mail order sources. Of course, I've seen the A-99 for less also.

I guess it depends on how much you value immediate availability. If that is important, then neither is greatly overpriced.

You know, these radios have really come down in price over the years. I can remember when the Washington was priced at about $600, and the Cobra 1000 was a bargain at about $550. And I paid that much for a Cobra 1000.

I guess the "good ol' days" were not always that good. :-)

I love how Radio Shack boy plays spin doctor and tosses it back at me.
1) You never originally said, you said any amount of power. Go look it up yourself in the posts, amigo. Nice try, though.
2) You just told the dude that no matter how much proof he had and how much proof of authnticity he had for the proof you would never believe him, yet

you demand it from me and would believe it. Why? Because I'm also a fellow ham, and he isn't? So I guess this makes you a close minded prejudice pompus ass.

You know, I also had a base station antenna from Radio Shack many years ago. It wasn't a Crossbow (at least I don't remember it having that name), but it was a darn good antenna. I received a lot of positive reports about it. It out-talked my neighbor's antenna by a long shot. It even did better than the three element beam that I had on the other side of the yard at the time.

But that antenna was discontinued many years ago and I have not seen anything like it at Radio Shack since. The antennas they have had over the last few years don't seem to work as well (at least that is what everyone says - I've had no personal experience with them).

Maybe that is why they decided to replace them with the A-99.

I haven't seen the Crossbow recently, but the A-99 is a little more advanced than what you describe. The top section has coiled wire running throughout the entire length. And, if I remember correctly, so does the middle section.

I'm not sure what the bottom section has. It is smooth on the outside with no visible wiring showing through the coating.

More importantly, the A-99's performance is outstanding. It has very wide bandwidth, with very low SWR over that entire bandwidth. And I have yet to see a similar styled antenna that can perform better than it does.

I think you hit the send button a few too many times on that one, ice. Having server problems or did you just want to make sure your message was read?

Anyway, I don't know why there are very few general+ hams posting to these discussions. Who knows, perhaps there are very few general+ hams reading this newsgroup. Or maybe they are more afraid to admit that they use a CB.

That may be the case here,

BUT!!!

It is common among HF circles to refer to the DXCC entities as countries.

Hell, if you look at the DXCC award rules, you will find that EVEN THE SPONSOR calls each entity a country!

Toll Free

John,

A properly adjusted rig, with an 'unlocked clarifier', should have the clarifier 'tracking' so that you DON'T have to muck. Where you run into trouble is people with 'fixed' transmit, each being slightly different, or misadjusted rigs.

But the big assumption here is 'properly adjusted'. With all the crappy mods done to rigs by people who have no idea what their doing (the saying a 'little' knowledge is dangerous really applies here, and it must be DAMN little!) no wonder most people have problems. I've seen people unlock clarifiers and NOT readjust them. And people tie them to voltage reference points in their rigs that just plain aren't stable enough and they sound like crap. Really, you should NOT be able to tell an 'unlocked' clarifier by it's sound on the air. The only thing that should give it away should be the fact the radio can 'move'. There's just too much shoddy crap out there.

Idealy, your tuning should work with BOTH your TX and RX, and they should track together. THEN you might (probably) want what's called RIT. I know, it's been mutated to say it stands for receive incremental tuning, but the very first time I saw that function on a rig, it was described in the literature ad "Receive Independant Tuning". This allows you to move your receiver around slightly without changing your TX.

Mike

Standard communications quality AM is about a 6 Khz bandwidth. But I was
not talking about Full carrier DSB AM, I was talking about SSB.
Typically the bandwidth of an SSB signal is between 2.5 and 3 Khz. With
this in mind, it gives rise to the belief that 2 signals on opposing
sidebands can occupy the same channel, without interference. In practice
this is only possible if the stations are not strong enough to overcome
the bandpass filter's rejection. We used to do it in the 70's when
channel 16 was the only "sideband channel". We had one group on USB and
another on LSB. There were few problems with co-channel interference. We
helped the situation by moving our clarifiers away from the other
sideband (Radios had moveable TX/RX clarifiers out-of-box back then)
instead of staying center slot.

If you run a narrower filter (1.9 Khz for example), you increase the rejection of the unwanted sideband, and will increase your ability to co-habitate on a channel with a person of the opposite sideband. The trade off, is that you roll off much of your audio fidelity. It will still be copyable, but just not as pleasent to listen to.
Narrower filters also have the added benefit of increasing the signal to noise ratio, which means better overall receive sensitivity.

If the FCC were to be hypothetically thinking about creating a "legal" freeband (I know the terms are mutually exclusive, but I'm just trying to illustrate a point), they would be able to make channel spacing 3 or 4 Khz wide, if we allow SSB only, which would effectively double the amount of channels available over what we would have with DSB AM.

If you stick with SSB, you can throw away the redundant sideband, and
you no longer need the extra bandwidth. Your fidelity at 3 Khz on SSB,
should be no worse than the normal 6 Khz on AM.

Communications grade audio is typically in the 300 - 3500 Hz range,
which is only about 3 Khz of needed bandwidth. The only reason we have
to double it, is to accomodate the extra sideband in the DSB AM signal.

I'm sure that the FCC officials are very well "aware" of the CB band for
whatever reason.

>
> Anyway, I have not seen any negative attitudes towards CB by the officials at the FCC. I have seen a demand that the rules be obeyed, and I have seen enforcement actions taken against those who did not obey the rules. But, I have not seen CB treated any differently than the other radio services.

The CB band HAS been treated differently. They have been mostly ignored by the FCC, since the FCC basically threw in the towel, when they eliminated the license requirement. When that happened, the CB band ceased to be a legitimate radio service, in the FCC's eyes, and became what it is now, a vast wasteland of frequencies, where the rules are no rules. The FCC only responds to flagrent interference problems. Other than that, until recently, the band was left to be whatever it was.

It looks to me that the CBer's got a case of "You asked for it, you got it", from the FCC. Since so many people never bothered to get licensed, even when it was required, the FCC eliminated the license, and with it, any sort of protection that the license gives you from interference. The FCC could not keep up with the wave of illegals, so rather than look ineffective, they abandoned the band.

This may be changing now, but the FCC still needs a ton of money to do an effective enforcement, unless the burden of policing the CB band, falls to the local law enforcement types (I hope that NEVER happens).

I think if the FCC was serious in providing a radio service for the citizens (In light of the relatively affordable competition from cell-phones), they would just do better to create a new band where DX would not be a problem, and far enough away from other radio services, that equipment could not be readily adapted.

My vote goes to the 72-76 Mhz band. Much less skip, but not so line-of-sight, as UHF, and not much commercial equipment that would drop in and be used without major modifications.

Funny thing. Back in the early 80's, when a guy named Dick Bash started
polling freshly tested hams, to put together his "study guide", which
contained actual test questions and answers. The ARRL and the rest of
the ham community jumped all over him, and accused him of circumventing
the learning process, and lowering the "standards" for becoming a ham.

In comes the VEC program and what does the ARRL do? Publish a "study
guide" with the pool of questions and answers. Talk about hypocracy!
This is one reason why I am not much in support of the ARRL.

Whoops! You are right. I was thinking tech plus. I still haven't gotten
used to the whole tech/tech+ thing. They should have called the no-code
and different name.

Note that the limitations imposed relates to emissions. The FCC could
give the CB band FM, but what's the point? What is their incentive?

>

What "rocks of truth"? There is nothing that he stated, that we don't
already know, or have stated for you numerous times. Maybe one of those
"rocks of truth" finally hit you on the head, and you had a brief moment
of clarity.

>
> "(Hint: 26 to 28 Mhz around the

> because "I SAID SO" said so? more bullshit.

The CB band was not intended to be more than a SHORT RANGE SERVICE. You
keep missing the point. It's violation of ITU regulations to be anything
else.

> "The only
> beef I could see with this arrangement and the ITU is that the ITU agreement
> states that the general usuage band we call CB can not be used for
> international contacts."

And THIS is precisely the reason WHY the FCC can't and won't expand the present CB band to DX type operation. That takes the wind right out of your "why can't we DX" arguement. THAT is why.

> i don't know when this was written into the agreement but, in this day of comparitive world peace, it doesn't seem to be needed anymore. there is always going to be some trouble in the world and if terrorists need long distance comms, they can always go to illegal use of high freq, short wave or the so-called "numbers" station set-ups or even something as simple as a telephone.

Think MONEY. The ITU is also a regulator of communications commerce. If they allowed international radio communications by "citizens", then they would use the free airwaves to circumvent paying long distance telephone charges.(loss of revenue for the communications companies that support the ITU) In fact, if you look at earlier FCC CB regs, there was a section that stated that CB could not be used if another form of communication existed (Since most cars did not have phones in them in the 60's, a base-mobile contact was considered legal, but 2 base stations should not communicate if they both had phone service available.

> this rule is no longer needed, nesessary or wanted by the majority of the people that it affects the most. the cb'er.

It's nice that you think that the whole world's communications, the ITU, the FCC and other agencies across the globe, are subjucated to the whim of US CBers.

> if these rules were to change, they would apply to hams and cb'ers alike so the hams would be welcome to increase their power / channel capabilities if they don't already have them.

Ah Obi-wan, come! Join the dark side. There is POWER on the dark side!

> many do but the ones that do, won't admit it in public and the ones who don't, deny that any of the others do.

So, since there are a bunch of lawless radio ops (hams and CBers), we should kow-tow to their wishes, to operate above the law.

> the only real, major opposition to any rule changes comes from the RF police types who appear to hold on to their licensed power / bandwidth privledges with great jealousy as they act like we should have to run the same gauntlet that they had to in order to get useful HF communications.

Why not? If you want something, you should have to work for it. The value of something is proportional to the amount of effort it takes to achieve it. Your idea of "RF welfare" is just a product of a small thinking person, who can't see the "big" picture, otherwise you wouldn't question why the FCC, the ITU or whomever operates, and the reasons for the rules. You see each and every rule as an affront to your personal "rights". You can't see beyond YOU. You come off like a spoiled child, which is why no one will take you seriously, except maybe, other disenfranchised, persecution complex people.

> their effort is laudable but not nesessary for an average family when one
> partner has the electronic appitude to pass the test and the other and / or the
> children don't.
> if the FCC would exercize their LATITUDE in this matter as mentioned above,
> there COULD be a license similar to the old cb license for a medium high
> powered "free band" that anyone in any family could get and use.

We have one. It's called GMRS.

> my wife hasn't
> got a clue about electronics and is not interested in learning but knows enough
> to turn on a radio, change a channel and key a microphone.
> for reliable communications between home and my job, for us, would require
> somewhat more than 4 watts am or even 12 watts pep. 100 watts pep would be a
> start in my case but i couldn't see a need for more than 300 watts max for this
> band.

Why? On the CB band, when the DX conditions are not there, I can talk 30 or 40 miles with 4 watts, and even more with 12 watts on SSB.

On the GMRS bands, you have access to repeaters that give your child's handheld the same coverage as your base station. This is more than adaquate, for a dependable reliable family communications service.

> i've talked all over the world from my mobile on 200 watts pep so it's not that
> big of a deal for 300 watts. one should be able to go anywhere with that. and
> if the band isn't open, more power won't make a difference anyway.

Now the other shoe drops. You're not REALLY interested in creating a "family" communications band. You REALLY want a free ticket to talk DX. That ISN'T GOING TO HAPPEN, until the ITU relaxes the rules.

If you'd spend your time and energy studying for and passing your ham test, you'd have what you want, instead of crying and whining about your "RF Welfare" band, and how "unfair" we all are for agreeing with the current system.

> "Unless some country complains, the FCC will
> only pay minimal duty to the CB Band, "
>
> here's the key!!! as long as there are people in charge of the FCC who are
> biased toward the ham communities' position, there will be no fair hearing for

> cb'ers.

You cannot substantiate with any sort of solid evidence that this "ham bias" exists. Even when you've been given the reasons from a source that you somehow trust, you still continue to banter on about the FCC changing the rules that they have no control over. The "Ham bias", that you claim, exists only in your persecuted, disenfranchised, and somewhat paranoid mind. You sound silly when you keep making these claims, especially when you can't back it up.

> "some countries have been
> complaining about our CB and Ham Bands which I think has sparked the
> current round of enforcement."
>
> this is something that could be worked out with an enforced, LICENSED band with

> skips within the first 23 channels of cb for r/c freqs.
>
> to all of you RF police people out there,
> if your parents would have slapped you down with a, "because i said so", and
> no other explaination every time you asked the question "WHY", you'd get pissed
> at them in a hurry.

NOBODY has ever told you "because I said so". I, and others, have told you on numerous occasions about the ITU, and why we can't have an international CB band, and you still refused to accept it, until another person corroborates the story. And now you can't accept the rationale of the ITU, and think that they sould just change their rules JUST FOR YOU and other supporters of "RF Welfare". Well, you can try. But you have to make your case, and not just because you say so.

> this is the way that we've been treated here on this news group.
> and then, to find out that all of the RF police either were mis-informed, too
> lazy to actually do some good by spelling out the situation as Martin has here,
> or lying / hiding the truth because it DOESN'T support your position has just
> un-plugged the last piece of life support afforded to your credibility.

You really know how to spin doctor information. What have you learned?
The ITU regulates international communications.
The ITU has set aside "purpose" bands, that local governments are free to regulate within the ITU guidelines. However they are not free to travel internationally. What's here that has not already been said by several people?

>
> now why don't we start over with some HONEST dialog and knock off the "BECAUSE

If you're THAT interested, Engage the use of your mind and a search
engine, and research the ITU and related material yourself. Unless of
course you belive that the internet is "ham biased" as well.......

> NOTE FOR MARTIN,
> just so i don't get accused of hiding anything, i have been a strong supporter
> of power and the out-bands.

Anything for free right?

> i have also been harsh and vulger in my reponses but, generally, in self
> defense of myself or others who have been attacked and clubbed by the RF police
> here in the last 3 months.

The majority of your "defenses" have been laced with a persecution
complex, innuendo, conjecture, and supposition (With no proof), broad
generalizations, stereotyping, ad hominem attacks, and paranoia. Not the
things to base a meaningful dialog on.

If you want the rules to change, you have to first understand WHY they
were created first. In order to do that, you have to get over that "Hams
are out to get us" complex. Once you understand the BIG picture, you can
judge for yourself if large international organizations, like the ITU,
may be reluctant to grant your wish. Your job is to mount an effort

(Yike, sounds like work!), to come up with clear, consise, logical and meaningful reasons to support your position, and then to submit it, in the proper forum.

Are you serious, are are you just another one of those "why me" types who sits and cries in their beer, but never makes any effort to bring about change.

My respect for you would increase dramatically if you acted on your notions to bring about change instead of trying to shove them down the rest of our throats. While we already know the reasons why and can accept them.

I have a like new Superstar 4900 10 meter radio recently purchased from
Bill's 2 way. I find that I'm not using it, will let it go for $150
plus shipping. This sells for $180 new. All ready for 11 meters.

For more info:

What horrible rules?   The restriction on radios in aircraft is to
protect the avionics. The real power at the FCC is the Telephone
powers.

Just a minor nit picky point.... The dBi of a half wave vertical antenna
in the real world is < or ~2.15, not three... And with matching losses,
the stacking gain in the real world is more like 2.5dB, not three... So
we get 2.15 + 2.5 = 4.65dBi (and this is on a good day, with a tail wind
and favorable sunspots, and a salt water surface - YMMV, SAR, BNI)
I strongly urge those who are impressed by manufacturers claims about
antenna gain to do some basic reading on antennas... Radio shack has
some books... The ARRL has a ton of books on antennas... The RSGB has a
many books... CQ magazine advertises a library of available books...
Ditto for 73 magazine... There are many independent authors offering
books... Your local library can borrow any book in the world through the
interloan program... (Zero cost to you - zippo, nada, nyet)
AND, there is an entire world of antenna theory available right here
online... Just use the search engine in your web browser...

The radials have almost nothing to do with pattern, except as they
might reduce feedline radiation.

Your RF Police will be covered in a future posting. The ARRL has no
official position on the CB Service expect to make sure an adverse
ruling regarding CB isn't carried over to the Amateur Service. Example
Hb 2346. see=www.thomas.gov

CB Band was originally set up to be for personal and business use in the mid 1950s by the FCC. Due to the limitations of Electronics and Transmitters of the day, VHF and UHF was basically very costly to develop radios for transmission. (Early CB weren't a bargain either-my father's Black Face Johnson cost over $200.00 a piece in the mid 1960's now=to about $1000.00). So, 27 MHZ, was "borrowed" from the Amateur Service as it is believed (BUT ITU didn't recognize any allocations in the 10 meter band below 28.00MHz, the FCC just decided to let the Hams park there and "study" the band?) The 150 mile (250km) rule was placed in effect but lets face it, propagation is a force of nature and the 27 MHZ region is affected by skip, propagation or whatewver. However ITU regulations frown on International Contacts Outside Common Carrier Circuits due to revenue loss to the phone COMPANIES. Even Amateur Radio has very strict 3rd party regulations between countries. In the US, repeater phone patch rules are very strict.
and was established in

Phone patch rules on CB were only adopted reluctently since phone
companies had mobile radio telephone service. Telephone Patches on
Amateur Repeaters can be a major source of sore spots even
today-cellular wants its pound of flesh.

GMRS has been downplayed by the FCC and the licensing scheme is complex
to say the least. It was old Class A CB. License costs $75.00 for 5
years, repeaters can be used or placed in service, it is in the 460MHz
area. A family only needs a group license, power limitation is 25
watts, portables allowed, auto patches allowed and a portion of the
frequencies have been turned over to FRS on a non exclusive basis.

The rules at the FCC ar usually bassed on the laws of physics as to
transmitter power, propagation and frequency usuage. Popular demand
could have created havoc in 1912 when the first Radio Laws passed. So
many people were setting up their own "radio stations" that the
commercial interests cried foul. With crude technology, there wasn't a
lot of room for the plethoria of transmitters which covered the airwaves
each night (Freq in use were below 1000 khz) so the congress stepped in
and turned radio over to the US Navy which promptly banned "Amateurs" to
below 200 meters, hence the cry 200 meters and below. Licenses were
granted by the Navy Dept to Amateurs but the cry to Congress was
tempered by the testimony from the Bureau of Standards explained to the
Congress how RF spectrum worked or so how they believed. With Amateurs
banished to 200 meters and below (1500 KHZ on up) Amateurs went ahead to
discover HF after WW I (In which ALL RADIOS were verboten!) Logic is
the key. Read about Radio History in the Days of the Giants.

Hi Tom,

I had also commented on that fact earlier and was told I was wrong.
Funny no references as to why I was wrong.

I can't seem to find where I'm wrong in the reference books here, but
then again what do people like Kraus, Jasik and the like know about
antennas?

Funny, I can't even get NEC modeling programs to show that adding
radials lowers the take off angle. Changing ground conditions? Yes.
Adding radials? No. They do increase the gain slightly by improving
the antenna efficiency but not the angle.

Of course, if you wish to blindly forge ahead with nothing more than
an advertising brochure as a foundation - then all things are
possible.

73
Danny

Dave,
You should read up on the early history of broadcast radio.
It was chaos. There were no controls or standards for frequencies
or quality. Any "flea power" station could power up on any
frequency and interfere with the competitor. Radio stations
were free to overpower the other stations and be as wide as
they thought was necessary to block or jam the other stations
on the band. The FCC put a stop to all this requiring the
licensing of all broadcast stations and limiting them to certain
band segments. Without the FCC the AM broadcast band would
sound just like the CB band. If you look for commies under
every rock you're sure to find them. I would say that the
FCC is closer to Romans than Marx because it curbs irresponsible
interference and controls the quality of the stations. If
it was a Marxist type creation it would require stations to
air only certain types of content and would jam incoming
signals from other countries.
Kevin, WB5RUE

Dave or Debby wrote in message <38302e9a@news.planetc.com>...

>Bravo on Jeff's remarks

thank you.

for the last 3 or 4 months, i've asked, in a nut shell, why are the hams here
if ham radio was so great?

why do they have to come here and shove their views down our throats?
if cb is so bad, why don't they abandond it for the holy grail, the ham bands?

if they are going to come here, if they can't help someone, don't like the
subject matter or if they don't have anything positive to contribute, don't say
anything at all.

i may not know as much as some hams but i have gone to rec.radio.amateur and
answered some of their questions.
i've gone there and asked a few of my own and had gotten answers in a
respectful manner, even when i've stated that i was an out-bander.
my questions wern't technical in nature but pertaining to RF phylosophy and
regulations. i didn't always get the answers that i wanted or agreed with but
they were friendly. here, if you ask a question about amps or mods, you get
someones keyboard shoved down your throat.
there was one poor guy here 2 weeks ago that asked a question about an amp.
the flame thrower came out from one ham shack billowing threats of the FCC.
if the ham would have looked at the guy's e-mail address, he would have seen
that it ended in, ". UK".
no FCC regs there.
it is things like this that has given them the name RF police.

not all hams are like this though. even some who disagree with the alternative cb life style. they are either neutral or helpful on antenna, power supply or in non-technical issues.
this is all we ask.

Nope, here are the definitions:

Liberals have rights, real and imagined. They want government to pass laws that guarantee that no one will violate any of their rights. They have no responsibilities, it is up to government to take responsibility for everything.

Libertarians have rights, real and imagined. They want government to pass no laws that would violate their right to do what they feel is right, which is up to their own individual interpretation. Responsibilities? They take responsibility for only those things that would not hinder the exercising of their rights.

Conservatives have rights, real and imagined as well as responsibilities. They want government to pass laws to remind us the difference between our rights and responsibilities. There can be no freedom without responsibilities.

They must be fools , because they never had the benefit of being educated at Roadway Tech.

I think this explains the widespread lack of understanding how antennas work on 11 meters. Things are, well, just different on that band.

this is why i hate unlocked clarifiers.
you play RF tag.
if more people would bring their internal xmit freq adjustment to the front
panel and broaden their RX only clarifiers, it would be less frustrating.

In an FM signal the frequency changes and not the amplitude, so is a cranked up power mic like the D104 really needed?

this is true, but could you imagine it with all of the radios out there today.
if every one could do this, you would need much better filtering than is in
most radios today.

the first cordless phone that rad shack came out with back in the 80's used 1 mhz AM for the base freq and 30 mhz AM for the hand set.
i bought one for my ex-wife so she could chatter on the phone while taking care of the baby.
i pulled into the driveway after work one night with the old style analog tuned AM car radio in my 73 pontiac tuned to a station near 1,000 khz.
i didn't know, at the time, what freqs the phone was on but that night i got a lesson in cordless phone technology and her extra curicular activities.
this is why she is my EX-WIFE. :):):):):):):)

Man you might want to get something besides that firebird before you do
that, some people prefer a linear with something besides a grounded bias,
and what if they only want 5 pills, there is nothing wrong with Texas stars,
I personally dont care for 1" transformers on a box you might drive, but the
Texas star 1 pill (2290) & 2 pill (2290) are hard to beat, Believe me on
this one.

[Somebody asked how is SWR measured]

> Greetings!
>
> Via voltage.

You're half right. An SWR meter senses both voltage and current. This is how it creates the directional effect to separate forward power from reverse power. It takes advantage of the fact that forward current is "in phase" with the forward voltage and the reverse current is the opposite phase of the reverse voltage.

For example, when measuring forward power, the meter samples both voltage and current and sums the two signals. The sensed signal from the forward voltage is summed with the sensed signal from the forward current to contribute to a power reading on the meter. Also summed into the reading are the sensed signal from the reverse voltage and the sensed signal from the reverse current. Because these two particular signals are "out of phase" (opposite polarity of each other), they cancel each other out and make no contribution to the meter power reading. Thus, you are able to measure the power in a single direction despite the fact that power can actually be traveling in both directions simultaneously.

A similar second measurement is made in the opposite direction to determine the reverse power. Once both the forward and reverse power are known, the Standing Wave Ratio (SWR) can be determined. "Standing waves" are created by the interaction of forward and reverse power on the transmission line. The respective voltages and currents add constructively and destructively to create nodes of high (and low) average voltage along the transmission line and nodes of high (and low) average current along the transmission line.

The "standing wave ratio" is ratio of the highs to the lows; it is, in essence, a measurement which basically describes the ratio of forward to reflected power.

Because of the directionality of an SWR meter, at any given time, it sees only the forward signal or the reflected signal. It does not see these standing waves, or nodes, on the transmission line because they are the sum of both forward *and* reflected signals. Thus, contrary to what some claim on the newsgroup, placing the meter at a current or voltage node will *not* render an inaccurate reading.

That is true.

That is not true. See my other post.

Perhaps, but not because of your second reason.

How is "power" 180 degrees out of phase? Do you have "negative"
power reflecting down your transmission line? Do you have a power
meter where the needle moves to the left when you key up? You must
have an anti-matter antenna. ;-D

That is not the characteristic impedance.
There is nothing "characteristic" about it; that is a genuine impedance.
"Characteristic impedance" is a term used to describe the relationship
between a voltage and a current when an actual impedance does not
exist. For example, a transmission line with a characteristic impedance
of 50 ohms will carry signals (in each direction) where the relationship
between the voltage (in a given direction) and the current (in the same
direction) is V/I = 50 ohms. There is no 50 ohm resistor (or resistance)
to be found; no power is being dissipated but the relationship between
the voltage and current are as if applied to a 50 ohm load. Thus, it
is a "characteristic impedance."

How do you know that the meter is being "fooled"?
You've jumped to a conclusion.

I really like my IMAX. Its a lot easier to set up. You find better sales on it too. I got mine for $60 NEW. I have great ears and get good reports. SWR's are 1:1.7 from 25.165 to 29.655 Mhz. They stay under 1.3 up to about 28.4 Mhz. I have mine strapped to the chimney 55' in the air (no guy wires & I don't need them). It weathers better than aluminum and weights only 6 lbs.

I am wanting to wire up a ParaDynamics Power Mic (echo and noises) to my Cobra 23 Plus (40 channel plus 3 weather bands). According to the Cobra website, they do not recommend putting a power mic on this unit. Does anyone know why? I have been having problems wireing it up to the 5-pin din connector that the radio needs. I "thought" I had it correct, but the radio would "moo" when i keyed - it gave a high pitch tone that would become low picth (imagine a bomb dropping).

Any ideas?

Josh Kittle

Ahhh, being a radio novice, I didn't realize that I was opening a can o' worms with my original post, makes me think it was a good question to ask! But, I really do appreciate all the opinions on radials for the Antron 99, both expressed here and via email.

My take on it (so far).... the Antron 99 is a decent antenna that won't break my wallet. It will be a worthy replacement for the 25 year old lightning rod currently on top of my tower. I think I will put it up and try it without radials... perhaps I will put them on later to see if they actually make a difference in my real world situation... There have been a few posters/emailers that have said they've made little or no difference when they've added them on, but it might be a fun experiment and reason to drive all the fire roads around our cabin with a mobile. If i do so, I'll make sure to post the results (and undoubtedly start another long thread in the process) ;)

thanks again,

Brent

What the hell are you talking about? You've created a completely
different scenario which has nothing to do with the question at hand.
A 50 ohm transmitter is not mismatched.

I'll spell it out for you:
1) Take your Smith chart
2) Consider a reflected signal traveling back down the transmission
line toward the radio.
3) You are using a typical CB radio with a 50 ohm output impedance.
4) Now consider what happens when that signal impinges upon the
50 ohm impedance at the radio.
5) Use your Smith chart to find the reflection coefficient for
50 ohms. Answer: 0.00

Why don't you quote me a chapter that disagrees with what I say?
It all comes from the book.

> Since there is a mismatch at the antenna - the impedance that the
> transmitter sees is not 50 ohms. The impedance that it does see
> can be calculated by formula. As the design impedance is not
> present - the finals cannot operate at designed efficiency.

Again, you are talking about the wrong impedance. We are talking
about the impedance seen by the power reflected back down the
transmission line. It sees the impedance of the transmitter which,
typically, is 50 ohms.

> The end result is the same - the finals get hot. It is just the
> mechanism is different than what you would think using simple
> logic.

Your analysis is flawed. You describe it as if no power goes up
and down the transmission line. You are using a "lumped element"
analysis for a "distributed element" system. This is a common
practice for simplifying a circuit for analysis but breaks down
under certain conditions such as this.

For example, if I transmit into an open ended transmission line
that is 1/2 wavelength long, the transmitter sees an impedance of
infinity at the coax input. Despite this infinite impedance,
current does flow into the transmission line all the way down
to the open end where it is then reflected back. This can be
proven with a power meter. I can measure power all along
the transmission line.
In fact, the transmitter would not see the infinite impedance
unless power were being reflected back.
Now, for some circuit design analysis, an infinite impedance
could be substituted for the transmission line here. But at
an infinite impedance, no current would flow. However, I can
prove that current does indeed flow because I can measure it
with a power meter. The reality is that current simultaneously
flows in both directions and the net current is zero.

I was just responding to his comment that a some FCC officials are ham operators, and therefore may be biased, by pointing out that some of them may also have been CB'ers at one time.

> The CB band HAS been treated differently. They have been mostly ignored

Oh yes, I'll give you that. The FCC has largely ignored the CB band. However, I was still responding to the original argument that the FCC was biased against the CB band and was treating CB'ers differently (more harshly) than the operators in other bands.

> This may be changing now, but the FCC still needs a ton of money to do
> an effective enforcement, unless the burden of policing the CB band,
> falls to the local law enforcement types (I hope that NEVER happens).

I don't think the FCC wants to lose control (any control) over radio, so I expect them to make a handfull of high-profile CB busts just before any CB-related bill in congress comes up for a vote. Even if it does not change anything concerning the vote, the FCC would then be able to at least claim that it was trying.

> I think if the FCC was serious in providing a radio service for the
> citizens (In light of the relatively affordable competition from
> cell-phones), they would just do better to create a new band where DX
> would not be a problem, and far enough away from other radio services,
> that equipment could not be readily adapted.

I have not seen any movement towards creating another service. In fact, the FCC's current attitude seems to be enough is enough (as far as hobby radio is concerned).

<<It looks to me that the CBer's got a case of "You asked for it, you got it", from the FCC. Since so many people never bothered to get licensed, even when it was required, the FCC eliminated the license, and with it, any sort of protection that the license gives you from interference. The FCC could not keep up with the wave of illegals, so rather than look ineffective, they abandoned the band.>>

Which is ironic, because if the FCC and ITU were to somehow accede to Jeff's wishes and create a lawless version of ham radio from 25 to 29 MHz with no power limits, no distance limits, no rules, and no enforcement....

...the result would be that all of 25 to 29 MHz would sound exactly like "the legal 40" does now. Maybe worse. You want no rules, right? Everything legal? Every Radio Shack could feature affordable CB amps and expanded coverage CB radios in their next Christmas flyer. Your pals at Exports-R-Us could make sure that vast quantities of affordable hi-power, full-coverage radios were available to all comers. Davemade, X-Force,

Skullcracka and other competition amp suppliers could come out of hiding and offer competing lines of 5 KW, 10 KW and 30 KW amps. And because there are no rules, any 12 year old kid could run his amplified echo-box radio right on top of your "DX Net". Sound fun? You'd better think so, because this is what you have been arguing so vehemently for, Jeff.

Brent,

Why don't you try to get a copy of the book "The Amateur Radio
Vertical Antenna Handbook" by Capt. Paul Lee, N6PL (SK). It is
relatively inexpensive and is obtainable from CQ.

http://www.cq-amateur-radio.com/

It is about 130 pages in length and I'm sure it will answer all your
questions regarding vertical antennas without the BS.

And we've answered that question many times before, Jeff. Many of our old friends still only have CB radios, so we keep our CB around to talk to them.

> why do they have to come here and shove their views down our throats?
> if cb is so bad, why don't they abandond it for the holy grail, the ham bands?

And we've addressed this also, Jeff. None of use has ever said that CB is bad, only that there are some illegal users who make it bad for everyone else.

> if they are going to come here, if they can't help someone, don't like the
> subject matter or if they don't have anything positive to contribute, don't say
> anything at all.

When you apply those same standards to yourself, we'll follow your lead, Jeff. You're the one in here ranting about ham operators. If you can't help someone, don't like the subject matter, or don't have anything positive to contribute, don't say anything at all.

> i may not know as much as some hams but i have gone to rec.radio.amateur and
> answered some of their questions.

You know, you've said this many times. What do you want, a medal? So what? How does the fact that you have answered a few questions in rec.radio.amateur justify your continued assault on ham operators in this newsgroup?

> i didn't always get the answers that i wanted or agreed with but
> they were friendly. here, if you ask a question about amps or mods, you get
> someones keyboard shoved down your throat.

Now that should be rather obvious, Jeff. If you asked about amplifiers in the ham band, then you were asking about something that was legal (ham operators can legally use a linear). An amplifier is illegal in the CB band, so you're not going to get the same response from the ham operators here.

I'm also sure that you did not spend weeks conplaining about ham operators (like you do here) before you asked your questions in rec.radio.amateur.

> there was one poor guy here 2 weeks ago that asked a question about an amp.
> the flame thrower came out from one ham shack billowing threats of the FCC.
> if the ham would have looked at the guy's e-mail address, he would have seen
> that it ended in, ". UK".

I saw that message thread, Jeff. Yes, the question was from a guy in the UK. He asked about linears, which he admitted was also illegal in the UK. The CB'er with a ham license responded that he should consider other options, such as a better antenna or better radio.

The Cb'er with a ham license only mentioned the FCC once during his entire response. I would hardly consider that "billowing threats of the FCC."

By the way, I also noticed that YOU did not offer to help the person asking the question. You decided to attack the CB'er with the ham license instead. You made a big fuss about the FCC comment, but did not contribute anything that would have helped the person asking the question.

> not all hams are like this though. even some who disagree with the alternative
> cb life style. they are either neutral or helpful on antenna, power supply or
> in non-technical issues.
> this is all we ask.

  Alternative CB lifestyle?? Now I have heard everything. What's next, Jeff? Are you going to march on Washington, hand-in-hand, demanding equal rights for your alternative lifestyle? I imagine that it is only a matter of time before you start claiming that you didn't CHOOSE to be an illegal operator, you were BORN that way.

Cutting D-9 causes over-modulation, watch the scope with a 1K tone injected,
very sloppy, tune the 1K Ohm potentiometer(VR5) for maximum power.

You cut R131 for modulation........Turn VR11 for ssb power(doesn't matter which
way you turn it. RV10 for AM power.

nope. to combine 3 ports you would use a 3 port combiner not a 2 port.

Wait until a good wind storm not only takes your antenna down but destroys your chimney as well. Then you will wish you had taken the extra few minutes to install guy wires.

All the export radios are attempts to sell CB'ers high profit margin, poorly engineered radios easily modifiable to operate with i llegal parameters. They are horribly expensive, and cheaply made. Look for a piece of used mobile ham HF gear (real ham gear, not the "10 meter" stuff that I just described) and have a tech modify it for 11 meters. You get a well engineered product (real selectivity, real speech processing, etc...) for probably the same or less money than one of the off-shore fraud radios.

Greetings!

Whap whap!

Please re-check your references.

Voltage is detected, show me a CB radio that uses a current sense versus the simpler and less intrusive voltage.

Waves 180 degrees out of phase occur on the shield as shield currents. Which when compared to reflection power within the coax center strand, the complex impedance the coax presents at the point of detection and the outer shield currents present, may alow the detector to actually sense LOWER effect of the reflected, due to summation, or nodal response. Basically, the coax currents being out of phase, results in a summation problem this is the error that makes "trim length" work like it does.

Summation during detection.

Please re-read your work!

While Dancing with the Mouse on Tue, 16 Nov 1999 15:03:01 -0500, the Modem interrupted with an MNI from "anylength@willdo.com (Coax Length Police)", and the MotherBoard buffered this to Video RAM:

I'll go along with that. This is what separates the radios from the toys. Not all SSB filters are created equal. I always wondered why I could hear more people than I could talk to. I finally figured it out. They couldn't hear me! No brilliant revelation there but I realized that my reciever was better. Proved it when sitting next to a friend with a HR2510. His radio was swamped with noise & bleedover while I could hear the station clearly and work him. Also noticed my receiver was more quiet during no-skip conditions yet could hear more distant stations. Most good buddies are too concerned about power mics, getting out, noise toyz and swinging audio to notice their receivers are shit.

Greetings!

When you finally settle down, re-read. I think it's time you took a moment or two to realize are you quoting me or Bill?

My own comments are mixed in.

Better break it down.

And while you're at it, take a moment and realize that you make more headway with the wind, then against it.

Please explain why coax length doesn't matter in the CB world, and I'll show you a resonate system. Show me a CB system that needs coax trimmed to length, and I'll show you what needs to be changed.

Care to date?

;-)

AM = Ancient Modulation; Awful Mode, Antique Microphones, Audio Muddy,
Absolute Mayhem

I'm sure you can think of some more. There's nothing that works very well
on AM. Squelch doesn't work well 'cuz it gets falsed by noise; you need the
carrier of the transmitting station to decode what they're saying; the IF
bandwidth is wide and lets in all sorts of noise; the modulation envelope
has a limit at 100%; any interference on the frequency will come through
the speaker. Blech! If CBers were a little more organized and orderly they
may have at one point had a case the lobby the government to allow other
modes, and possibly other frequencies, on CB. I can't see that happening

```
now. What I can see is licensing the band for some real' noisy commercial,
scientific or industrial purpose that would wipe it out for CBers.
Something like over-the-horizon radar, wind profiling, vehicle positioning,
meteor scatter communications etc.

John,
You are not too detail oriented now, are you?  Allow me to quote the =
original thread:

"Any one got any ideas how to turn up the output on a Uniden PC66XL =
Radio????
Email me please."

Now I sure as heck don't see the user requesting both a pubic and =
private (e-mail) reply.  He is blatantly requesting a private e-mail.  =
He is even courteous and polishes off the request with a "please".  I =
think I have a flair for the obvious, John.

Also, John, I have 31 years military and commercial experience with =
SMTP/NNTP protocols (yes, they're that old), so I'm pretty sure I know =
how to use MicriSh*t Outlook to post in newsgroups.  I was building and =
optimizing ARPANET (...and among other systems you've never heard of) =
before you even knew what a PC was.

Nevertheless, I refuse posts that are requesting information via private =
e-mail.  Back to my original statement:  This is a public newsgroup.  =
Questions/requests made public should be answered public.  That is what =
I think is fair.

73's, and don't tie up 119!

PB010

Not true no such thing as an odd amp with this design, the 4,6,8,10,12,14,16 etc all the way up all use the same type combiner every 2 pill stage gets another port, notice i didnt say 2 pill because of course no combiner is

needed. So when combining 2 x 2 pill stages(4pill) a 2 port is used for
that, when combining 3 x 2 pill stages(6pill) a 3 port combiner is used,
when 4x 2 pill stages are combined (8 pill) then a 4 port, (10pill) 5 port,
so a (12pill) would get a 6 port , and (16 pill would get a 8 port combiner)
and so on. Or it could be built in 4 pill stages you would then use a 3
port combiner to combine the 3- 4 pill stages(12pill). Not sure what you
were trying to say. But they do use the exact same thing,.

>"Sandbagger"

If both sidebands were used in this manner a USB signal at 27.402
would directly interfere with a LSB signal on 27.405. So that in
keeping with this thread, the idea of multiple channels without a
full AM signal being present, we would only be able to obtain a
maximum three times the amount of channels. Spaced at 3.3KC's, or
120 closely spaced channels.

Not all SuperStars run bigger than a 32 Pill. Especially in Hawaii.
ModSquad is running an 8 pill, BIG Shot is running a 16 Pill, Big Poppa is
running a 3 Pill, StoneSkippah is running a 16 Pill, Money in the Grass is
running a 16 Pill and so on so forth. Small boxes but getting out. You

decide.

137... back out!

In the mini grass conditon, position make a big difference. Lots of guys
hooked up to 6-8 elements beams too. Depends on which side of the island you
are on. If you have nothing but water in front of you look out, if the
mountains are in your face tough luck. Ask Mod Squad who built his 8 pill.
He is out there with guys running much bigger stuff than him.

I would tend to agree with the amp draw crakerjack, but he can use 2 -250's
on the 32 and still see good watts of course 3 or more would be much
better, but I don't think he is going to get in any keydowns just yet and if
he does he should could add the 3rd one, or there are many other tricks he
could do like series some 12 volt batterys for 24 volts then when he keys it
will naturally dip. I don't see many people who put shit in there vehicle
not make changes they are always upgrading and fine tuning everything,
especially with something of this size. He will learn from it

You have had enough. Good. So has everyone else. Now that you may have exhausted just about the last shred of credibility that you may have retained, there is only one way to redeem yourself and regain some credibility among these posts. That is to admit you were WRONG. We all are from time to time. But if you refuse to believe that type of DXing is possible(it is, was, and will contiue to be) despite the amount of operators that have refuted your claims, and cannot admit you are wrong, then you might as well come incognito 'cause anyone who knows a thing about radio is going to ignore anything you may have to say. Or read it as the joke of the day.

Good Info... Thanks.

I'll try to compile all the info and come up with a step-by-step process for the Mods.

Sounds as if this beast of a radio is one of the most difficult to properly modify.
Good think I waited for the input of this group.

I would conclude that the ST must be taken care of prior to mods.
Too bad it was useful to pull in weak AM. (Horrible for SSB).

I'll wait a few more days until the posts stop, then make the mods.

Sure do wish I could pass the game plan by someone prior to committing.

One additional point. Maximum legal height for an 11 meter antenna is 60
feet above ground.

If that antenna has been up there that long with the same coax, it's
time to replace the coax. If the antenna is still bad after you replace
the coax, then replace it. A friend and I put an antenna along a trail
in the woods. When we get some new working coax, we'll try it again.

Thank you for repeating that. It's too obvious to me, but some folks
just don't get it.

Got a new radio to play with today. Actually, it has been on the market for
quite a while, but nobody I have talked to stateside has EVER seen one.

It is a model President James, 240 (26.065 to 28.755) Channel AM / FM unit. Very similar to the President George in that the unlock codes are the same. The modification to get it up and running on all 240 channels was a breeze, and easily found on the internet.

Hooking it up on the bench, I see stock out of it just as President advertises.... 2 watts to 8 watts variable key (both AM and FM), and 100 percent modulation wherever you set the carrier. This works out to nearly 25 watts PEP on all the way up, and slightly less than 10 watts PEP with the carrier control all the way down.

RX section was good.. Very good sensitivity, however, I did notice one quirk... When on the A band, on channel 5, I could hear 27.025 the same as if I was on 27.025. Not harmonically related, but plain as day. Could be a quirk, or could be something related to my setup. Not sure, and didn't really play with it long enough to see if it was due to being cold or something similar.

After doing a slight tune-up on the bench, the radio really came alive... I could set the carrier as low as 1 watt, and up to 18 watts. When set to 18 watts, it would hold 100 percent modulation, and swung to a rock solid 50 watts!

Low power (amc defeated, variable turned up all the way) I was able to see 1 watt swinging to 35 watts! This is a low level modulated radio, and I will be the first to say that I was VERY skeptical because of this, but as in the George, it sounds great! However, unless you run near 4 watts of carrier (like a Galaxy), it sounds distorted on AM.

Their are separate power controls (internal) for AM and FM, so you can set the am section of the transmitter up to do exactly what you want, then crank up the FM section for even more power output. FM works great, as well.

I set mine up to do 10 watts of carrier and swing to 28. This seemed to sound the best, and corresponds to 100 percent modulation (or nearly so).

Radio has a roger beep (which is QUITE low in frequency... Sounds very distinct), reverb (they call it echo) that is quite pleasing.. Sounds like someone in a grocery store when their is nobody in it at night. This is variable, but I left mine where it was when I got the radio.

For metering, it is the standard Uniden 90s model LED display... Ala Pro 610e. Looks good, and you can make out what it is saying. Includes Mod, S/RF and SWR.

Radio does scanning both in memory channels (unfortunately, their are only 4, but they do hold frequency and mode) as well as band scan. I was unable to test the bandscan because of the high level of skip in tonight. Maybe next time.

Radio has dual lighting, green and orange.. Guess Alpine and Kenwood got their standards even in the CB market! ;-)

Anyway, this looks to be a good radio. I am happy with it, and will keep it and use it, rather than stuff it in the closet where most of the other "export" radios are sitting. I haven't ever seen one in the states, and neither has anyone else that I talked to. I picked it up via auction on E-Bay, so it was used, but I am happy with both the deal and the radio.

If anyone else has questions, feel free to ask.

25 watts has gotten me to the Falklands, Japan, Australia on 10 meters,
I did work the S.Pole station KC4AAA. All is possible with an opening.
However, China has just allowed Amateur Radio, the transmitters are kept
at club locations but htere is talk of allowing home base sets. Comms
are very tightly controlled. Remember the square?

Hi,
I am looking for a mint condition Regency Range Gain II 23 channel tube CB transceiver. Would prefer the original mic and manual. Will pay good price for such a radio , box would be a real plus!
Email me if you have one of this description.
Thanks
Bruce

The ground radials chief function is to help decouple the antenna from the coax.

A typical end fed half wave mounted one wavelength high over average ground will have 3.09dbi at a 24 degree takeoff angle.

Adding four quarter wave drooping ground radials will take this same antenna to 3.47dbi at the same takeoff angle

O.K.

Mine runs at 16.5 day to day, and I have rolled it up to nearly 20 before.

Last time it blew, I was at 24+ volts, but that was because the regulator
failed and the alternator went full field.

i listen to 6 a lot and all I hear is the person talking to toll not toll himself.
I know your going to say Im full of sh!t but it is true

Then, he goes on to say.....

So, either I am a mudduck, or he hears people coming back to me all the time.

One way or the other, you can't have your cake and eat it too...

If you want to hear me, listen at 11:30 to 12:30 CST for lunchtime skip, then again at 4:00 to 5:00 in the afternoon, CST, for the skip on the way home.

I am out their a grand total of 2 hours a day, unless I stay out because I am having fun, or because their is nothing else to do.

Still, if you hear people coming back to me, how can I be a duck?

One way, or the other.

What I was trying to say is that you would not use a 2 pill combiner to run a 12 pill box on.

It is hard enough to get the balancing right on a two port combiner to where you are not burning up resistors, and most amp builders cannot get that right.

Dave and Cookie seem to do it right, so they have decent boxes for running "odd" sizes of pills in.

Still, you need to run the correct amount of drive into them, and then you are stuck with running odd pilled amps.

It seems easier to me to run a even number of transistors, then when SOMETHING does go wrong, the local idiot can fix them, rather than having to send them back to the manufacturer because he is one of about 10 people in the US that can understand how a port combiner / splitter REALLY works!

Okay. I didn't think the ST's were any longer an issue, since I am not a genius (I pretend I am to myself though) I thought this information was old news. I apologize for not contributing earlier:

25WST
Remove C809 and C819. Short pins 1 & 2 of IC802.

29WST
Remove C821 and C809. Short pins 1 & 2 of IC802.

29LTD-NH
Remove C809. Cut trace between IC801 pin 10, and IC802 pin 4. Short pins 1 & 2 of IC802.

148GTL-ST
Remove C35 and C16. Short pins 3 & 5 of the connector on the channel selector PCB.

I believe I go them in order. I'll help where I can, just email me.

Hank
